THIS IS AN UPDATE ISSUE. THE INDICES MAY BE USED TO REPLACE THE INDICES IN THE CUMULATIVE ISSUE (PUBLISHED QUARTERLY). THE INDIVIDUAL REPORTS MAY BE USED TO REPLACE PAGES IN THE CUMULATIVE FOR CHANGED REPORTS, AND ADD PAGES FOR NEW REPORTS. AT THE END OF EACH ISSUE WILL BE A LIST OF REPORTS WHICH WILL NOT APPEAR AGAIN IN AN INDEX BECAUSE THEY WILL HAVE BEEN CLOSED OVER 90 DAYS.

THIS DOCUMENT CONTAINS, IN THE ORDER SHOWN, INFORMATION ON ALL PROBLEM REPORTS EITHER NOW OPEN OR CLOSED WITHIN THE LAST 90 DAYS:

1. INDEX BY CATEGORY. CATEGORIES ARE GIVEN BELOW.
2. INDEX BY HP PART NUMBER.
3. THE COMPLETE TEXT OF EACH UPDATED OR NEW REPORT.

THE STATUS OF A REPORT IS GIVEN ON THE SECOND LINE OF EACH ENTRY IN THE INDICES. THE FORM IS AS FOLLOWS: [MM/YYAX] WHERE X = N FOR NOFIX, O FOR OPEN, C FOR CLOSED, AND F FOR FIX DATE GIVEN. C AND F HAVE CLOSED AND TO-BE-FIXED DATES ASSOCIATED WITH THEM. AN A PRECEDING THE CODE MEANS THAT THE REPORT HAS BEEN CHANGED SINCE IT WAS FIRST LOGGED.

THE ENTRIES IN THE FIRST INDEX ARE SORTED FIRST BY CATEGORY (CODES SHOWN BELOW) AND BY PART NUMBER WITHIN EACH CATEGORY.

TITLE: REJECTS CALL TO SUBR WITH 6 CHAR NAME ALTHO RTETG TAKES IT

PROBLEM: IF A TABLE ENTRY IS GENERATED BY RTETG FOR A SIX CHARACTER SUBROUTINE NAME, A CALL TO "CALLS" WILL SHOW THAT SUBROUTINE AS ACCESSIBLE. HOWEVER, A CALL TO THAT SUBROUTINE WILL PRODUCE AN ERROR MESSAGE "MISSING OR ILLEGAL SUBROUTINE IN LINE XXX".

EXPLANATION: THE ROUTINE LNAME IS USED TO MOVE THE SUBROUTINE NAME INTO A BUFFER. THE CALL TO LNAME HAS TWO PARAMETERS BUFFER ADDRESS AND NEGATIVE OF THE NUMBER OF CHARACTERS IN THE NAME PLUS ONE. FOR A SIX CHARACTER NAME, THIS WOULD BE A -7. ONCE IN LNAME, THE BUFFER IS BLANKED OUT BEFORE MOVING THE SUBROUTINE NAME INTO IT. IN ORDER TO DO THIS, THE NUMBER OF CHARACTERS MUST BE CHANGED TO THE NUMBER OF WORDS.

THE CODE TO DO THIS IS THE FOLLOWING:

```
        LDA LNAME,I      GET NEG NO OF CHARS +1
        SLA              IF ODD, TRY TO MAKE EVEN
        INA              ADD ONE CHARACTER
        ARS              MAKE WORDS OF IT.
```

BUT THE INA ADDS ONE TO -7, MAKING IT -6 INSTEAD OF -8 AS DESIRED.

ACTION: UNDER INVESTIGATION. IN THE MEANTIME, USE SUBROUTINE CALLS OF LESS THAN SIX CHARACTERS.

PROBLEM: ENTERING A MNEMONIC TABLE NAME OF MORE THAN 7 CHARACTERS CAUSES BASIC TO PRINT "INVALID FILE NAME" AND THEN GO INTO INFINITE LOOP PRINTING "FILE OR CARTRIDGE NOT FOUND OR NO DISC SPACE".

EXPLANATION: TYPE >TABLES BRNCH:RT,MNEMC:RT  
TYPING SEMICOLON INSTEAD OF COLON CAN CAUSE IT.

TABLES COMMAND IN SEGMENT 5 CALLS NAMD0 TO GET NAMES. NAMD0 CALLS LNAME TO GET FILE NAME. WHEN 8 CHARACTERS ARE ENTERED FOR MNEMONIC TABLE, LNAME STORES THE FIRST 6 CHARACTERS IN MNNAM IN COMMON. WHEN 8TH CHARACTER IS FOUND, LNAME EXITS TO ERROR TO PRINT ERROR MESSAGE. ERROR CALLS A ROUTINE IN SEGMENT 2. IN SEG 2 IF MNNAM IS NON ZERO, IT TRYS TO LOAD MNEMONIC TABLE. WHEN THIS FAILS, ANOTHER ERROR IS GENERATED AND IT GOES INTO THE LOOP.

TITLE: BAD COMM. LINE CAN CAUSE OTHER LINES TO LOSE DATA.

PROBLEM: IF A DS NODE CONTAINS MORE THAN ONE MODEM CONNECTION TO OTHER DS NODES, AND IF ONE OF THE MODEM CONNECTIONS AT A HIGHER PRIORITY SELECT CODE THAN SOME OF THE OTHERS STARTS SENDING STRINGS OF BAD DATA, THEN THE LOWER PRIORITY MODEMS CONNECTIONS CAN BECOME LOCKED OUT AND DATA CAN BE LOST.

EXPLANATION: THIS PROBLEM OCCURS DUE TO THE USE OF TIME-OUTS IN THE MICROCODED SECTION OF THE DS DRIVER TO ENTER THE SOFTWARE SECTION OF THE DRIVER FOR BOTH CONTINUATION AND COMPLETION OF TRANSMISSIONS. THE REASON THE PROBLEM OCCURS IS THAT DVA65 IS IN "LISTEN" MODE FOR THE LINE, I.E. IT HAS ENABLED DVM65 FOR A ONE WORD READ, AND IS EXPECTING EITHER A STOP OR AN RC. IF DVA65 RECEIVES ANY OTHER WORD BESIDES THESE IT WILL DO ONE OF TWO THINGS. IF THE WORD CONTAINS ZEROS THE DRIVER ASSUMES A BROKEN LINE AND STARTS A COUNT, IF IT THEN RECEIVES 66 SEQUENTIAL ZERO DATA WORDS, THE DRIVER WILL SET THE BROKEN LINE FLAG AND DISABLE "LISTEN" MODE. HOWEVER, IF THE WORD IS NON-ZERO BAD DATA THE DRIVER WILL RE-ENABLE "LISTEN" MODE AND EXIT. IGNORING THE BAD DATA AND RE-ENABLING "LISTEN" MODE CAUSES DVM65 TO DO A ONE WORD READ AND THEN SET THE TIME-OUT TO 10MS SO THAT DVA65 MAY RESPOND AS SOON AS POSSIBLE. ASSUMING A LOT OF BAD DATA COMING ACCROSS THE LINE AND A HIGH PRIORITY FOR THE LINE, IT WILL BE TIMING-OUT CONTINUALLY AND WILL CAUSE ANY TIME-OUTS FOR THE OTHER LOWER PRIORITY NODES TO GO UNRECOGNIZED RESULTING IN THE LOSS OF DATA.

ACTION: UNDER INVESTIGATION. A TEMPORARY FIX THAT HAS BEEN PROPOSED IS TO TREAT STRINGS OF BAD DATA THE SAME AS STRINGS OF ZEROES. TO INCORPORATE THIS FIX, DVA65 MUST BE MODIFIED AS FOLLOWS:

EXPLANATION : WHEN SERVICING AN XSID REQUEST TO LOAD A PROGRAM, THE  
DRIVER IS EXECUTING IN THE SYSTEM MAP, BUT THE DMA  
PORT IS SET UP TO SEND DATA INTO THE USER MAP. WHEN  
A CORRECTABLE DATA ERROR OCCURS, THE DRIVER OBTAINS

IT IS EXECUTING IN THE SAME MAP AS THE DATA BUFFER. IF NOT

TITLE: PROBLEMS WITH GASP INITIALIZATION WHEN NOT ENOUGH ROOM ON CART

DURING GASP INITIALIZATION, IF THE CARTRIDGE INTENDED TO CONTAIN THE SPOOL FILE IS NOT LARGE ENOUGH, GASP ANNOUNCES THAT THE DISC IS FULL, AND HOW MANY FILES WERE CREATED. GASP THEN ASKS IF THE USER WANTS TO DEINITIALIZE SPOOLING. A "YES" RESPONSE GETS A GASP -11 ERROR WHICH IS NOT DOCUMENTED, GASP THEN TERMINATES. A DIRECTORY LIST INDICATES THAT GASP DID NOT PURGE ANY OF THE SPOOL FILES THAT IT MANAGED TO CREATE BEFORE THE DISC WAS FILLED.

THE USER MUST RUN GASP AGAIN, DEALLOCATE SPOOLING USING THE DA COMMAND, AND THEN BEGIN ALL OVER TO INITIALIZE SPOOLING.

EXPLANATION : SAME AS ABOVE.

ACTION : UNDER INVESTIGATION. MAKE SURE ALL SPOOL FILES WILL FIT ON THE SPECIFIED CARTRIDGE.

AN ALTERNATE SOLUTION TO THE PROBLEM IS TO USE THE 1926 VERSION OF THE HPIB SOFTWARE.

EXPLANATION : THE BASIC MANUAL STATES THAT "SINCE A FUNCTION

TITLE: MULTI-UNIT MT DRIVES GET ERRONEOUS WRITE RING STATUS

PROBLEM : TAKE A SCENARIO WHERE YOU HAVE DAISY CHAINED MAG TAPE UNITS. ON ONE UNIT YOU ARE WRITING A TAPE FROM A PROGRAM USING EXEC(2...) REQUESTS. YOU THEN MOUNT A TAPE ON ANOTHER UNIT WITH NO WRITE RING AND ATTEMPT TO READ THE TAPE WITH A FMGR 'ST,LU' FILE NAMR COMMAND. IMMEDIATELY THE UNIT YOU WERE WRITING TO GOES DOWN, I/O NOT READY, WITH A NO WRITE RING STATUS. IN OTHER WORDS THE STATUS FROM THE WRONG DRIVE WAS TAKEN AT THE START OF THE WRITE REQUEST.

EXPLANATION : BY PATCHING THE DRIVER TO LOG REQUEST INFO STATUS AND UNIT SELECT COMMANDS WE FIND SEVERAL CIRCUMSTANCES THAT LEAD TO THE PROBLEM.

- 1) AT THE START OF THE FMGR 'ST' COMMAND IT ISSUES AN EXEC 3 REQUEST WITH A FUNCTION CODE OF 7. THIS IS AN ILLEGAL REQUEST TO A MAG TAPE AND SO THE DRIVER RETURNS WITH A = 2 THROUGH I.23 TO REFUSE THE REQUEST.
- 2) FOR SOME UNKNOWN REASON JUST BEFORE THE DRIVER RETURNS TO RTE IT DOES A 'STC CMND,C' INSTRUCTION AT 206R IN THE DRIVER. ACCORDING TO THE MAG TAPE INTERFACE MANUALS 13181A, 13183A A 'STC CMND' SHOULD NEVER BE DONE AFTER A SELECT OPERATION UNLESS ANOTHER COMMAND HAS ALSO BEEN PLACED IN THE MAG TAPE INTERFACE COMMAND BUFFER. AT ANY RATE THE 'STC' INSTRUCTION CAUSES THE INTERFACE TO GO BUSY FOR SOME TIME PERIOD.
- 3) HOWEVER THE A = 2 INITIATOR TELLS RTE THAT THE CONTROL REQUEST IS NOT DEFINED. RTE WILL CALL THE DRIVER AGAIN FOR THE EXEC(2) REQUEST FOR THE OTHER MAG TAPE UNIT. IN THE 'SETIO' ROUTINE OF DVR23 THEY DO A NEW UNIT SELECT AND PICK UP THE STATUS. HOWEVER THE REJECTED BIT IS SET BECAUSE A UNIT SELECT WAS ATTEMPTED WHILE INTERFACE BUSY IS SET AND THIS IS NOT CHECKED FOR SINCE RTE ASSUMES THE INTERFACE IS NOT BUSY UPON INITIATION OF A NEW I/O OPERATION. AS A RESULT THE STATUS FROM THE READ DRIVE IS PUT IN EQT WORD 5 DURING SETIO FOR AN INITIATOR CALL TO THE WRITE DRIVE. FOR A WRITE REQUEST AT 20 AND 21R THERE IS A CHECK FOR A WRITE RING WHICH FAILS BECAUSE WE HAVE THE STATUS FROM THE WRONG DRIVE. AS A RESULT THE DRIVE IS SET DOWN BY RTE.

ACTION : THE PROBLEM SHOULD POSSIBLY BE FIXED BY REMOVING THE 'STC' COMMAND AT 206R AND THE 'STA STCIM' AT 563R IN SETIO. THIS COULD BE PATCHED IN THE DRIVER WITH 'NOP' INSTRUCTIONS.

THE FUNCTION CODE 7 EXEC 3 CALL FROM FMGR IS USED TO SKIP  
LEADER ON PAPER TAPE DEVICES SO THAT COULD BE FIXED BY  
CHECKING DRIVER TYPE BUT SHOULD NOT BE NECESSARY SINCE I  
BELIEVE THIS IS REALLY A DRIVER PROBLEM.

TITLE: SCEGN INCORRECTLY LINKS INDIRECT EXTERNAL REFS.

PROBLEM : IN A CASE WHERE EXTS. PRECEDES CORRESPONDING ENTS. IN THE LOADING PROCESS, A MEMORY REFERENCE INSTRUCTION OR A DEF INDIRECT TO THE EXTERNAL PRODUCES A LOADER SYMBOL TABLE ENTRY WHICH IS LEFT UNRESOLVED. THE RESULT IS THAT THE LINK IS 177777B OR EFFECTIVELY, DEF 77777,I. IF THE PHYSICAL LOCATION IS PRESENT(EG. IN A 32K 21MX), THIS CONTAINS 100100B, OF DEF 100B,I. THUS, A MEMORY REFERENCE INSTRUCTION ENDS UP REFERRING TO THE LOCATION POINTED TO BY 100. IF THE MEMORY IS NOT PRESENT (IE. < 32K) THE EQUIVALENT REFERENCE IS 0,I I.E. THE A REGISTER CONTENTS IS THE EFFECTIVE OPERAND ADDRESS.

NOTE: IF THE ENT PRECEDES THE EXT IN THE RELOCATING SEQUENCE THERE APPEARS TO BE NO PROBLEM.

EXPLANATION : AS ABOVE.

ACTION : AS A WORK AROUND USE ONLY DIRECT REFERENCES (MEM. REF INSTRUCTIONS OF DEF'S) TO EXTERNALS. IF THIS IS IMPOSSIBLE, ENSURE THAT ANY SUCH ENT'S ARE RELOCATED BEFORE THE EXT'S.
