This introductory chapter is a brief explanation of the content and format of the Software Update Notice (SUN).

1.1 Purpose of the SUN and how to use it.

The SUN accompanies software, firmware and/or manual updates. It is designed to be a reference document to describe product changes and to give general considerations on how to incorporate these changes in the system.

The SUN performs basically three functions:

1) Describe the changes that have occurred within a product for both maintenance and enhancements (Chapter 2). If the change is in response to a Service Request from the field, this is noted. The descriptions are meant to be a quick overview to give the user a condensed look at the changes. More specific information must be obtained from the particular product's updated manuals.

When changes made to a product affect the generation, loading, or installation of that product, mention is made in Chapter 4. Again, for specific instructions you should refer to the appropriate manual.

- 2) List the Current Revision Codes, Updated Media and Manual Part Numbers for each product (Chapter 3). This chapter indicates:
  - the current revision codes for the software modules and firmware belonging to a product,
  - the software media part numbers and firmware that are being shipped in this update cycle; these media will contain the updated software for a particular product,
  - the part numbers of the manuals that are being updated in this update cycle.

Chapter 3 is not intended to replace the Software Numbering Catalog or Software Numbering File for each product, but rather it is intended to be a quick reference source for revision codes and a help in determining what media and manuals will be received by a customer for a particular product.

3) Describe different media formats sent to a customer along with a brief explanation of the Software Update Procedures associated with each media (Chapter 5). All software media can be read by HP-supported utilities which are described in various manuals. The user is directed to the appropriate reference manual for more specific instructions.

How to use the SUN:

The following are some suggestions to help you use the SUN as the reference it was intended to be:

- When you receive the SUN, check Chapter 1 for any changes that might have occurred in the SUN format and could affect how you will use it.
- Depending on the products for which you have a subscription service and the media you have chosen, you will receive a set of software and/or firmware media and manuals. If you are unfamiliar with the media you have received, check Chapter 5 for a description of the media format and suggestions for update procedures.
- Before you regenerate your system or load any software on-line, be sure to look through Chapter 4 to see if there have been any changes to load or generation procedures.
- Chapter 3 can be used to resolve any confusion concerning what software or manuals you should have received. Any software files or manuals that have been deleted from or added to the product will be highlighted there.
- Chapter 2, along with the updates you receive for your manuals, describes the corrections and enhancements made in this update cycle.

IMPORTANT NOTE: The SUN is only a quick reference document for an update cycle and is not intended to supersede the product manuals. Refer to the product manuals for the precise information on how to use the product.

#### 1.2 Update Naming Convention

The naming convention for update cycles is:

x.yy where: x = A,B,C, etc

yy= last 2 digits of year

e.g. A.83 = the first software update in 1983.

This naming convention will be used in all references to a particular cycle.

This current update cycle is referred to as 'A.84'. While this is the second update we have shipped this year, as was explained in the C.83 SUN, we could not simply change the name of that update. Thus, this is the first update in 1984.

The software in an update may be of different revision codes. This means that the revision code of a software product does not indicate the update cycle in which that software product will be released. An example would be: update A.88 could be released in March 1988 and could contain Graphics software of revision 2750, Image software of revision 2801, DD.00 driver of revision 2810, etc.

The next update is scheduled for the second quarter of 1984. It will be called A.85 (previously called B.84). It will include major operating system updates for RTE-A and RTE-6/VM.

#### 1.3 SUN Format Changes

Chapter 2 is in a slightly different format. Entries are still sorted by product but are now additionally sorted by the type of entry: Enhancement, Problems/Solutions, and Notes. When available, a

KPR number is given (KPR entries come first within each subsection).

At present, KPR entries are not sorted. In the future they will be.

There have been some changes to the format of chapter 3 to allow use of the new hierarchical file system on RTE-A and RTE-6/VM. At this update, some products will be shipped in TF format. The files will be in a hierarchical structure with global and subdirectories. Also, individual file names can be up to twenty-one characters long (including the dot). To accommodate this, two changes have been made.

- The file name field was expanded from six characters to twenty-one. To accomodate this, the module field was eliminated.
- For products that are shipped in the hierarchical file format, path names are given on a separate line to help identify where specific parts can be found.

TF format is only used on subsystems that run only on RTE-A and RTE-6/VM (e.g., Debug/1000 and Image/1000-II). Other subsystems will remain unchanged (in format).

For specific information on updating systems in the new hierarchical file format, please refer to chapter 5.

Chapter 5 has added information about new media formats. Also, a new file called HPHPHP has been added to most update formats. Check chapter 5 for specific details.

DESCRIPTION OF SOFTWARE CHANGES | CHAPTER 2 |

This chapter lists the reasons behind the software changes in this update. Where applicable, a Known Problem Report (KPR) number is given. The entries are of three types: Problem/Solution, Enhancement, and Note. A Problem/Solution entry describes the problem and the basic steps taken to solve it. An Enhancement entry similarly describes a change to software that improves its utility or makes it easier to use. A Note entry is useful information about a change that may have some impact but is not directly related to a software fix or enhancement. All entries are sorted by part number. For information on individual files that have changed, see chapter 3.

2.1 (24398A/B) Offline Peripheral Diagnostics (L, A-Series)

#### 2.1.1 Enhancements

ENHANCEMENT: Support booting from MAC-HPIB devices.

ENHANCEMENT: Diagnostic support of MAC-HPIB discs on the A-Series.

ENHANCEMENT: Provide a diagnostic for the new tape drives (7974/7978).

#### 2.1.2 Problems/Solutions

None.

#### 2.1.3 Notes

NOTE: The 7906, 7920 and 7925 Mac discs have been added as additionally supported discs as of this release. These discs require an HP-IB interface and adapter kit to be used on the A-Series.

NOTE: For information regarding the changes made to the 24398A/B product for MAC-HPIB support, please see the HP 1000

ICD/MAC Disc Diagnostic Reference Manual (5955-4355). For changes to the RTE-A operating system made to support the MAC-HPIB Drives, please see the 92077A section in this chapter.

NOTE: For information regarding the changes made to the 24398A/B product for 7974/7978 support, please see the HP 7974 Magnetic Tape Drive Exerciser Manual (24398-90007). For changes to the RTE-A operating system made to support the 7974A magnetic tape drive, please see the 92077A section in this chapter. The 7978A magnetic tape is not supported in RTE-A at this time.

#### 2.2 (91750A) DS/1000-IV

#### 2.2.1 Enhancements

ENHANCEMENT: DS/3000 nodes will now be viewed by DS/1000 nodes as level one nodes and will no longer have to go through the input converter, INCNV.

ENHANCEMENT: PGMAD will observe the father-waiting bit in RTE-A ID segments. The session-handling parts of DS/1000-IV are concerned with allocating resources based upon father-son associations between programs. The intended definition of this relationship is that the father program is waiting until the son program terminates, but this information was not available in previous RTE-L-derived ID segments. It was recently added to the RTE-A ID segment. PGMAD now checks the father-waiting bit.

ENHANCEMENT: Under a system where SAM is nearly fully utilized, messages from old nodes (level 0) may not have been delivered to the appropriate monitor after they have been converted to new message format (level 1). This is because additional SAM was required to accommodate the conversion. This problem could be avoided if enough SAM were allocated by taking into consideration the possible message header expansion. In this case driver 65 was responsible for SAM allocation. Therefore a new driver DVB65 was created just to do this. The driver recognizes two new subchannels, types 30B and 31B. If the LU (EQT) is configured as either of these types and the message is a DS message (not download message), the driver adds six words to the incoming message size before scheduling QUEUE

to receive the message. NOTE: DVB65 is special and works only in specific network topology. See the DS/1000-IV Network Manager's manual Vol I. (91750-90010) for details.

#### 2.2.2 Problems/Solutions

#### KPR 2200009142

PROBLEM: Under certain conditions DS/1000-3000 programs running

over X.25 would abort. This was because the no-abort bit

was not set in one EXEC call within D\$X25.

SOLUTION: Set the no-abort bit in the call.

#### KPR 2200000547

PROBLEM:

If PRCNM was called by a program with no father process or the father process had not established a session on the 3000, a jump was made to a common error processing routine. Upon completing the error processing, a return was attempted through the wrong entry point. This would cause a DM or MP violation.

SOLUTION:

PRCNM has been modified to perform its own error processing rather than call the common routine. PRCNM will now return a negative one (-1) in the B register if an error is encountered (i.e. no father or no process established on the 3000). If no error is encountered a zero is returned. In addition, the user need no longer call PRCNM with the Session Main Process (SMP) number created by the father. PRCNM will check for any ancestor program which has established a session on the 3000 and use that session number as the SMP number. The user may call with any non-zero value to establish communication and they will be returned the SMP number. In memory based systems a call with a zero value should be used to clear old communication data from any previous runs of the program.

#### KPR 2200009480

PROBLEM:

When QCLM received messages from RQCNV and attempted to output the time sent by RQCNV, it would abort with IOO4 errors. This was due to the fact that the two words of time sent by RQCNV were reversed.

SOLUTION:

The routine in RQCNV which set up the message to send to QCLM has been modified so that the two time words are now sent to QCLM in the correct order.

PROBLEM:

If a program did a remote schedule of a program which then in turn wrote back to the same node, i.e. bounce back, a problem would arise after multiple iterations of this. Scenario: Assume program A is run from a transfer file at Program A does a remote schedule with wait of program B at node 2. Program B does DS calls back to node 1, i.e. uses a bounce back session at node 1. program B completes, program A ends and the transfer file loops back and repeats. After multiple iterations of the transfer file (on the order of 32) the user will begin to see RSO1(0) error messages reported at node 2 by node 2 on alternate requests sent to node 1. The other requests will complete successfully to node 1. If EXECW is OFed, the RSO1(0) symptom will clear up.

SOLUTION: Each time EXECW handles a schedule request the EXECW sequence number is incremented. The error came about when #MSSM read the session ID word out of the POOL entry and failed to mask off the EXECW sequence byte. The sequence number eventually rolled over and destroyed the flag bits of a word in the NAT which used the session ID value. The alternating errors came about due to an NAT (network access table) entry being created and then destroyed on alternate messages. The solution is just that #MSSM now masks off the EXEXW sequence number when it retrieves the session ID value from the POOL.

#### KPR 5000002832

PROBLEM:

Remat gave the user a REMAT 056 error (bad parameter) when a purge command (PU, file) was executed from a REMAT transfer file.

SOLUTION: Remat had a bug in the purge processing section which caused the command to not be interpreted as ASCII. The error was that the wrong register was set up for the call to ASCHK (ASCII check). The proper register is now being set up for the call.

#### KPR 2200007534

PROBLEM:

When multiple 3000 programs accessed the same 1000 file via RFA, the first user would get an error when the second user was granted access to the same file. This was because RQCNV placed its own ID segment address in the ID segment word of the DS/1000 message it built on behalf of the 3000 user. When RFAM received two sets of requests for the same ID segment, it returned an error to the first user.

SOLUTION:

RQCNV now puts the from process number of the 3000 (SMP) in the lower byte of the segment address word of the DS/1000 message. Additionally, RQCNV puts the 3000 LU in the upper byte of this word. This change will allow multiple 3000 programs to access the same 1000 file. Notice that under this scheme, two programs running under the same 3000 session (with the same 3000 SMP) will NOT be able to share the same 1000 file.

#### KPR 2200009134

PROBLEM: An undefined entry point was introduced in the C.83 update

(2340) in DS/1000-IV systems without links to a 3000. The

entry point was: FC4FL.

SOLUTION: Add a dummy FC4FL to D\$DND.

#### KPR 2200007559

PROBLEM: Carriage control directives from the 3000 were not always

handled properly by D3KMS. In particular, there was no code in D3KMS to print forms control before the print to

\$STDLIST (pre-spacing).

SOLUTION: Code was added to D3KMS to handle forms control before

prints. In adition code was added to support FCONTROL 1

(forms control FCONTROL).

#### KPR 5000007344

PROBLEM:

There were numerous cases when DS/1000-IV was operating on top of X.25 when error recovery was not handled properly. These occurred running DS/1000-3000 and DS/1000-1000. To correct these problems, changes were made to X.25 and to DS. X.25 implemented a "release pool LU" (RPOOL) call for A.84. This call is necessary to release X.25 pool LUs allocated for DS/1000-3000 communication. The DS/1000-IV software was changed to make this call where necessary. The change required a new library pair to be created. Systems using X.25 pool LUs to communicate with an HP3000 should use the library \$D3X25. Systems NOT using X.25 pool LUs for 3000 communication should use the library The old modules %D\$X25 and %D\$N25 have been \$D3N25. incorporated in the new libraries. Note that these relocatable parts (16262 and 16266 respectively) have been obsoleted since they are part of a library and no longer separate parts. X.25 pool LUs were added to the 3000 LU table. DINIT now asks a new question to find out how many table entries are required for X.25 Pool LUs. question is only asked if DINIT is loaded with the library \$D3X25, and "YES" is the response to the question "HP 3000?". UPLIN now performs the cleanup of the X.25 pool LUs. Prior to A.84, it already cleaned up bisync LUs in the 3000 LU table. DSINF will now print out all X.25 pool LUs allocated to DS/1000-3000 programs in addition to DS/1000-3000 bisync LUs. HELLO was changed to release X.25 pool LUs on HELLO/BYE errors. QUEZ is now informed when X.25 pool LUs go down, and QUEZ prints an error message on the system console, as it currently does for bisync LUs. The error number will be 6 in the case of X.25 LUs. QUEZ is told that the LU went down via CSV66 and QUEUE.

SOLUTION: The changes described above were made to DS/1000-IV.

PROBLEM: UPLIN assumed that if a program was in state three it was all right to send it a time-out message. However, there are some circumstances where a program can become buffer limited and be in state three and unable to process messages on its class. If this happened, the master TCB would time out. UPLIN would see that the TCB had timed out and send a time-out message to the program. Since the program was unable to process messages, UPLIN would continue to send these time-out messages every five seconds, thus fragmenting SAM.

SOLUTION: A new meaning has been added to a bit in the time-out word of a master TCB. Bit eight in this word now indicates the TCB has timed out. When the timeout counter expires and rolls over to set this bit, a time-out message will be sent to the master program. Subsequent runs of UPLIN will check this bit and know that a time-out message has already been sent and no others will be sent.

PROBLEM: Bit 11 of the CONWD is defined as part of the function code in RTE-A but is undefined in RTE-6. DEXEC rejected calls with this bit set (except for the DEXEC extension to EXEC 1 known as "Interactive Write/Read").

SOLUTION: Permit bit 11 to be set in any call. Interpret it as Interactive Write/Read if ICODE is 1, otherwise pass it on to the operating system.

PROBLEM: An erroneous error was reported when DS/1000-IV tried to use an uninitialized link; a DS04(2) was reported. CSV66 refused to process the open line request if its own link status was up while X.25 link status was down. There was no line fail message for the 1000 to 3000 monitor QUEZ.

SOLUTION: Modified CSV66 to correct the problems; add code to send link down message to QUEZ (new message type for QUEUE known as type 7) and error code 6 (bit 4 - 7 in status word) is added.

#### 2.2.3 Notes

NOTE: These changes require that if X.25 is used, it MUST be the A.84 version.

#### 2.3 (91751A) DSN/X.25 1000

#### 2.3.1 Enhancements

ENHANCEMENT: The name of the LINK command files used to load the DSN/X.25/1000 product were changed to replace the "/" (conflict with the new file system) by a "\*". In addition, on the A-Series the transfer file names were changed to reflect their use on RTE-A only.

ENHANCEMENT: The name of some modules were changed to better reflect their use on RTE-A only.

#### 2.3.2 Problems/Solutions

#### KPR 2200054767

PROBLEM: If XTLOG and XPLOG were run simultaneously, the XTLOG file

was corrupted.

SOLUTION: The Resource number handling between XNET, XTLOG, XPLOG

was redesigned to take this conflict into consideration.

#### KPR 5000007062

PROBLEM: Abort and formatter error messages were sent to the

Virtual Circuit LU.

SOLUTION: DVX00 and DDX00 were modified to send error & abort

messages to system LU 1 when host-to-Host circuits are

involved.

#### KPR 5000007302

PROBLEM: The primary program that was specified to be scheduled for

a PAD Virtual Circuit (CI version) could not be

rescheduled after exiting from the program.

SOLUTION: DDX00 was modified to handle this situation correctly.

#### KPR 5000007328

PROBLEM: The subroutine HELLO & BYE did not always deallocate their

resources when using DS/DSN over X.25.

SOLUTION: Part of the solution to this problem was a modification of

the POOL LU allocation scheme by the XNET program. The DS/1000 counterpart was also modified to correct this

problem.

PROBLEM: If both the PRIMARY and SECONDARY programs were busy, the

user was not able to get the "RTE:" prompt.

SOLUTION: DDX00 was corrected to handle the new RTE-A message map,

which also corrected this problem.

#### KPR 5000007690

PROBLEM: Regular RTE breakmode did not work from a PAD terminal.

(Regular breakmode is defined to be the "S=lu COMMAND ?"

prompt in RTE-6/VM and the CM prompt in RTE-A.)

SOLUTION: Both XNET and DDX00 were modified to handle unsolicited

PAD data properly.

#### KPR 5000007708

PROBLEM: System Abort messages were not displayed on a PAD

terminal.

SOLUTION: DDX00 was corrected to handle the new RTE-A message map.

#### KPR 5000004747

PROBLEM: IF two RTE-6 systems were linked with X.25 and DS/1000 and

one system was halted, SAM was corrupted by DS/1000-IV.

SOLUTION: This problem required modifications in DS/1000, the LAP-B

firmware and X.25/1000. A new timer (T3) was implemented in the LAP-B firmware to detect that the host is halted

and consequently disconnect the X.25 level 2.

#### 2.3.3 Notes

None.

#### 2.4 (92077A) RTE-A Operating System

#### 2.4.1 Enhancements

#### KPR 2200007633

ENHANCEMENT: A pair of programs (DSAVE/DRSTR) has been added to do physical saves/restores to/from removable disc media. They will allow physical backup to a removable media e.g. micro-floppies in an environment such as a Micro/1000 system with integrated peripherals.

- ENHANCEMENT: Support of the 9134XV 15 Mbyte winchester disk was added to driver DD.30. A GEN record was added to for default device driver parameters. See chapter 5 for information about the 9133XV (15 Mbyte winchester w/micro-floppy).
- ENHANCEMENT: Device Driver support of MAC-HPIB discs on the A-Series has been added. The new device driver is DDM30.
- ENHANCEMENT: Interface Driver support of MAC-HPIB discs on the A-Series has been added. The enhanced interface driver is ID.37.
- ENHANCEMENT: A special driver needed for 24398B ICD/MAC diagnostics and FORMT systems has been added to RTE-A. The driver, IDM37, is only used for user-built FORMT systems.
- ENHANCEMENT: Support of booting from MAC-HPIB devices has been added. This software will work with in conjunction with the current VCP firmware, Revision level 4004, or any later versions.
- ENHANCEMENT: Formatting support of MAC-HPIB discs on the A-Series has been added. The enhancements necessary have been made to FORMT.
- ENHANCEMENT: Library changes (\$DKLIB) for support of MAC-HPIB discs on the A-Series have been made.
- $\begin{array}{c} {\tt ENHANCEMENT:} \ \, {\tt FTEST} \ \, {\tt has} \ \, {\tt been} \ \, {\tt enhanced} \ \, {\tt to} \ \, {\tt support} \ \, {\tt MAC-HPIB} \ \, {\tt discs} \ \, {\tt on} \ \, {\tt the} \\ {\tt A-Series.} \end{array}$
- ENHANCEMENT: IO program support of MAC-HPIB discs on the A-Series has been added.
- ENHANCEMENT: LDTYP support of MAC-HPIB discs on the A-Series has been added.
- ENHANCEMENT: The capability was added to the CS80 driver (DD.33) to support stand-alone CTD as a peripheral by removing disc caching for that LU. This enhancement will allow the 9144A to be added to the system using generation parameter M9144. Due to the loss of cache (i.e. using start/stop mode) the performance of the 9144A is about 30% of a cached CTD. RTE-A will be enhanced in the future to support streaming mode. The 9144A is not supported as a bootable LU.

ENHANCEMENT: Add the capability to DDC12 to change the device time out through a control request or generation time parameter. This will allow for printing of longer graphics buffer dumps such as vector graphics or bar codes, both of which are supported by 2566A and 2563A. Worst case for both printers is 14 meter printouts. CN,1u,22B,<interface to>,<device to> is the command string with times given in tens of milliseconds increments.

ENHANCEMENT: ID.50 has been enhanced to allow support of the video card (12065A). The following changes to the software were necessary:

- Cancel AUTO bit of DMA Control Word on both input and o
   Substitue DMA read/write information in place of option
  parameter to be used as card control register (neces
  for future graphics support to work).
- Cancel clearing of control register on driver exits. All of the above enhancements were made to the subfunction 40 control request. Previously this request used the two least significant bits (0 and 1) of PRAM 2. Now bits 2 and 3 are used for video functions.
- ENHANCEMENT: A new driver, DD.24 has been added for the 7974 and 7978 magnetic tape drives. The 7974 is supported as of A.84 in start/stop mode. Increased performance of the tape drive in streaming mode is a future change requiring RTE-A operating system modifications. The 7978 is not supported until the operating system changes necessary to allow streaming mode are made. These changes are estimated to be completed at the time of the next update to RTE-A (A.85, see chapter 1).

#### 2.4.2 Problems/Solutions

PROBLEM: Sometimes a program would memory protect if there had been a lot of swapping at the time of the power fail. The routine \$SELR was being called by mistake while processing the power fail entry.

SOLUTION: ID.27 was changed to use \$SETR. This will set the relocation register to the correct map for the DVT.

PROBLEM: After a top of form is output to a line printer, a <CR><LF> is output causing the paper to advance one line.
SOLUTION: DD.00 has been modified so that when setting up for a formfeed, bit 7, which is the inhibit <CR><LF> bit, is set in the control word so that the interface driver will not append a <CR><LF> to the output.

<sup>-</sup> Software Update Notice -

#### 2.4.3 Notes

NOTE: Due to the increased size of the RTE-A operating system

caused by the aforementioned enhancements, the mininum

128k bytes memory system is no longer supported.

NOTE: The edit help file name has been changed from "EDIT. to

EDIT.HLP::SYSTEM.

#### 2.5 (92081A) Image/1000-II

#### 2.5.1 Enhancements

None.

#### 2.5.2 Problems/Solutions

#### KPR 5000011668

PROBLEM: The tables generated by DBDS did not correctly list the

path and sort items.

SOLUTION: Code was corrected in DBDS to correctly list the path and

sort items.

#### KPR 5000011288

PROBLEM: DBLOD did not restore a data base which had a corrupt key.

SOLUTION: Display the record that could not be put into the

database, in both octal and ASCII format.

#### KPR 2200008540

PROBLEM: Loss of the transaction log file could result in missing

transactions in the roll-forward log.

SOLUTION: The reason the last transactions may not be in the roll

forward log is because they are spooled. The solution was to make spooling an option, controlled through the DBUTL

LG command.

#### KPR 2200008532

PROBLEM: A database could be corrupted if an intrinsic needed to be

rolled back immediately following a checkpoint.

SOLUTION: This condition has been corrected so that the before image

file will always contain the necessary information.

#### Software Changes (92081A)

PROBLEM: IMAGE-II needs Pascal.lib and Pascal Cds.Lib.

SOLUTION: Include Pascal.lib and Pascal Cds.lib in IMAGE-II.

PROBLEM: The IMAGE product structure did not conform to the new

file system naming conventions.

SOLUTION: The IMAGE product components are renamed to follow the new

file system conventions.

PROBLEM: DBMON was too large to be loaded on an A-Series due to

\$VMA\$ calling FmpBuildName and related subroutines.

SOLUTION: Make DBMON smaller.

2.5.3 Notes

None.

2.6 (91823A) Control/1000

#### 2.6.1 Enhancements

ENHANCEMENT: Support for thermocouples was added to the Control/1000 software. This consists of ten additional subroutines accessible by the user from \$MCLIB. Modifications to \$DEMLB were also made to allow access of these subroutines by the program DEMON. Finally, \$DEMLB was modified to provide for additional error checking when running DEMON.

2.6.2 Problems/Solutions

None.

2.6.3 Notes

None.

#### 2.7 (92833A) Pascal/1000 (RTE-6/VM, RTE-A)

#### 2.7.1 Enhancements

#### KPR 2200032458

ENHANCEMENT: Pascal has been enhanced to permit the synonyms for standard symbols that are described by the ANSI and HP standards.

#### KPR 2200001735

ENHANCEMENT: Pascal/1000 did not support the HP Pascal string data type (as Pascal/3000 does). As of revision A.84, Pascal/1000 meets the HP Pascal standard (including support of the string data type).

ENHANCEMENT: Pascal/1000 has been enhanced to allow generation of either CDS or Standard code by the compiler. The compiler itself is provided in both CDS and Standard versions.

#### 2.7.2 Problems/Solutions

#### KPR 2200001305

PROBLEM: Pascal compiler reported error 261 (literal pool overflow) in routines with large numbers of literals. The compiler used a fixed size, non-expandable table for pooling literals.

SOLUTION: The compiler was changed to use a dynamically allocated data structure for literal pooling. Error 261 can no longer occur.

#### KPR 2200001552

PROBLEM: Accessing single elements of a PACKED ARRAY OF CHAR caused syntax errors (often of the 400 and above variety).

SOLUTION: A correction was made to the tree transformation routines so that code could be correctly generated for such access.

#### KPR 2200002311

PROBLEM: Syntax error 448 occurred using WITH statements on certain PACKED RECORD types.

SOLUTION: A correction was made to the tree transformation routines so that code could be correctly generated for such statements.

PROBLEM: Syntax error 427 occurred using an expression in the

decimal position field when writing a REAL or LONGREAL

expression to a TEXT file.

SOLUTION: The write routine parser was corrected to permit an an

expression in the decimal position field and to provide

the correct information to the code generator.

#### KPR 2200004648

PROBLEM: Insufficient error information was provided when more than

one EMA/VMA object was passed to a VAR parameter specified with HEAPPARMS OFF. Error 398 was reported and was only

reported once.

SOLUTION: The routine call parser was changed to provide a more

specific error (Error 198: Heap variable may not be passed by reference in this context) and to report this

error for each parameter which is in violation.

#### KPR 2200007484

PROBLEM: \$PLIB revision B.83 (Rev. 2326) contained an entry point

ERRO so that it could intercept ERRO calls. If the library was included in the SNAP, it could cause Pascal library routines to be loaded with non-Pascal programs

which reference ERRO.

SOLUTION: Pascal no longer attempts to intercept ERRO calls, and the

entry point ERRO is no longer in the Pascal library.

#### KPR 2200007963

PROBLEM: Pascal misnamed the default relocatable file when no

working directory was active (e.g., WD,0).

SOLUTION: The monitor program, which expands default file names, has

been corrected to generate the appropriate default file

name.

#### KPR 2200020636

PROBLEM: Pas.GetMemInfo2 returned an incorrect value for the

initial top of heap for some sizes of VMA.

SOLUTION: Pas.GetMemInfo2 was corrected to return the correct value

for the initial top of heap for all sizes of VMA.

#### KPR 2200021238

PROBLEM: PACKED ARRAYS OF CHAR inside PACKED RECORDs may have been

accessed incorrectly.

SOLUTION: A correction was made to the tree transformation routines

so that code could be correctly generated for such

accesses.

PROBLEM: Comparison of two valid set denotations (set of an

enumerated type) caused a value out of range runtime

error.

SOLUTION: The set denotation parser was corrected to provide the

correct information on the value of the set denotation

components to the code generator.

KPR 2200024562

PROBLEM: EOF was not properly detected for type 1 files causing FMP

error -12 to be reported.

SOLUTION: The library has been corrected to properly detect EOF for

type 1 files.

KPR 2200025015

PROBLEM: The sequence

Pas.GetMemInfo2 (Info);

Pas.SetMemInfo2 (Info);

Pas.GetMemInfo2 (Info);

yielded incorrect results.

SOLUTION: Pas.GetMemInfo2 and Pas.SetMemInfo2 were corrected so that

this sequence yields the correct results.

KPR 2200027219

PROBLEM: A user supplied Pascal error catcher (Pas.ErrorCatcher)

was entered twice, first with a FMP -6, and then with a

FMP -11, if reset failed to find a file.

SOLUTION: The reset procedure in the library was modified to report

at most one error on any given attempt to open a file.

KPR 2200030684

PROBLEM: The PACKED modifier did not distribute to multiple

dimensions in an array type specification. For example:

FOO = PACKED ARRAY [1..10, 1..10] OF BOOLEAN;

was equivalent to

FOO = PACKED ARRAY [1..10] OF

ARRAY [1..10] OF BOOLEAN;

SOLUTION: The array specification processor was modified to correctly distribute the PACKED specification (as per

ANSI/HP standard) so that the first specification above is

now equivalent to:

FOO = PACKED ARRAY [1..10] OF

PACKED ARRAY [1..10] OF BOOLEAN;

KPR 5000004127

PROBLEM: Access to large PACKED ARRAYS in HEAP 2 could fail because

mapping was performed incorrectly.

SOLUTION: The code generator was modified to map correctly for such

access.

PROBLEM: The routine Pas.AlSharedSize in the Pascal library was

type 4 instead of type 7.

SOLUTION: The routine Pas. AlSharedSize has been corrected to be type

7.

KPR 5000007849

PROBLEM: Pascal scheduled MACRO even if no relocatable or a

relocatable of zero was specified.

SOLUTION: Pascal has been corrected to not schedule MACRO in such

cases.

KPR 5000010447

PROBLEM: Single character lines in files created on a new file

system volume were seen as empty by the Pascal compiler. If the character was a comment delimiter, the comment

delimiter would be ignored.

SOLUTION: The source file scanner has been corrected to properly

handle single character lines.

KPR 5000013755

PROBLEM: A multiplication that should have been done in two-word

integer mode was done in one-word integer mode. As an

example:

PROGRAM foo (input, output);

VAR

digit: CHAR;

sumget: INTEGER;

BEGIN

readln (digit);

sumget := 26\*26\*1000\*(ord (digit) - ord ('A'));

writeln (sumget);

END.

SOLUTION: The tree transformation routines were corrected to cause

the code generator to do a two-word multiplication.

KPR 2200002071

PROBLEM:

A Pascal subprogram unit used with a FORTRAN (or other non-Pascal) main program, required the entry points Pas.1 and Pas.2, which are not in any libraries. The problem was that the subprogram unit in question declares one or more of variables, string literal constants, or structured constants in its global declaration part. Variables, and string literals, and structured constants which are declared in the global declaration part of any compilation unit, are expected by the Pascal compiler to have been allocated when the Pascal main program unit (with the same

declarations) was compiled. Subprogram (or segment) compilation units containing such declarations can only be used with a Pascal main program containing the same declarations.

SOLUTION: The MODULE construct, available with revision A.84, provides a method to group related routines along with "globally" accessible constants and variables in such a way that such "libraries" can be used with non-Pascal main programs.

KPR 2200004457

PROBLEM: A declaration of a structured constant equated to another structured constant elicited a syntax error 398.

SOLUTION: An enhancement had been made to permit this construct, however it was not permitted before A.84. A correct program can be described with the syntax diagrams, but all paths through the syntax diagrams do not generate correct programs (often because of semantic issues). For example, INTEGER is an identifier, but unless it is redefined as a variable, you cannot say:

INTEGER := 10;

although the syntax diagrams permit:

<identifier> := <expression>;

In addition, this bug reports that error 398 occurs; error 398 is specifically an implementation restriction on a construct that would normally be allowed (and in this case which is allowed at A.84).

#### 2.7.3 Notes

NOTE: The \$XREF\$ (and the cross referencer) are no longer supplied as of revision A.84.

#### 2.8 (92836A) Fortran-77

#### 2.8.1 Enhancements

KPR 2200006049

ENHANCEMENT: FTN7X has been enhanced to allow the \$ALIAS directive to appear anywhere within the user's program, provided it appears before the first reference to the variable being

ALIASed.

ENHANCEMENT: If the source file name is given without an extension, and the file is not found, the type extension .FTN is added to the name and the file is looked for again.

ENHANCEMENT: Some symbol table space was recovered by using the eighth page of EMA. Note that the load file #FTN7X has been changed to allocate 8 pages of EMA (if EMA is to be used).

#### 2.8.2 Problems/Solutions

#### KPR 2200000752

PROBLEM: Character variables could not be initialized with data statements. Save statements in procedures seem to work fine, however any character variables declared locally to the procedure cannot be initialized with data statements. No error occurs when both data and save are used but character variables contain nulls rather than values they were initialized to.

SOLUTION: This problem is fixed in A.84.

#### KPR 2200001446

PROBLEM: Programs with Null characters (000000) at the end of a write statement compiled correctly, however run time errors occurred during execution. Compiler should ignore nulls or convert to blanks.

SOLUTION: FTN7X currently allows null characters to appear within strings and Hollerith fields (they are illegal elsewhere).

#### KPR 2200002832

PROBLEM: When in ANSI 66 mode, if a program declared the intrinsic routine PCOUNT to be INTEGER\*2, FTN7X would not treat a reference to PCOUNT as an intrinsic but as an external.

SOLUTION: FTN7X was treating INTEGER\*2 as an illegal type for PCOUNT, so it assumed that it must be external. Now, FTN7X treats both INTEGER\*2 and INTEGER\*4 as legal type for PCOUNT, and it will treat it as an intrinsic (as it should).

#### KPR 2200003913

PROBLEM: The fortran compiler produced incorrect code in the situation shown in the following assignment statement:

Character\*(\*) old(\*)
Integer oldlengths(\*)
Integer this, ind

ind = INDEX('...\$1...',old(this)(:oldlengths(this)))

The problem occurred when any expression (in this case an array element) was used to define the substring of a string array.

SOLUTION: The software has been corrected.

KPR 2200004358

PROBLEM: FTN7X set up its .IMAP call incorrectly when passing an

EMA array to a subroutine.

SOLUTION: The software has been corrected.

KPR 2200006031

PROBLEM: An internal compiler error occurred in the following

subroutine:

SUBROUTINE SUB(IA)

WRITE(1,IA)

END

FTN7X was treating the variable IA as if it contained a statement number (which is correct), but, it was losing one level of indirection when it used the variable. This caused it to pick up garbage for the format statement.

SOLUTION: The software has been corrected.

KPR 2200006213

PROBLEM: Double precision real calculation on an A700 with hardware

floating point sometimes failed with exponent equal to 0.

SOLUTION: FTN7X was modified to avoid generating the .BLE

instruction with overlapping operand and result (avoiding

a firmware problem).

KPR 2200007278

PROBLEM: When compiling a subprogram with a cross reference

specified, some symbols had a reference to the same line number. This problem only occurred when passing a

character variable to a subroutine.

SOLUTION: The software has been corrected.

KPR 2200007856

PROBLEM: If a character variable appeared as a parameter in more

than one ENTRY statement (or a SUBROUTINE/FUNCTION statement and an ENTRY statement), the compiler aborted with an internal error. This only occurred when the same

character variable appears more than once.

SOLUTION: The software has been corrected.

KPR 2200008243

PROBLEM: When using DECODE, and the number of characters in the

buffer was variable, it was possible for FTN7X to doubly use the temporary storage location that held the length of

the buffer.

SOLUTION: The software has been corrected.

KPR 2200008565

PROBLEM: With CDS on, FTN7X didn't handle properly the case where a

procedure was passed to a routine as a parameter, and then

passed to another routine. For example:

External Proc call Sub1(Proc)

. . .

Subroutine Sub1(proc)

call Sub2(proc)

. . .

Subroutine Sub2(proc)

call Proc()

With CDS off, this code works okay.

SOLUTION: The software has been corrected.

KPR 2200008953

PROBLEM: FTN7X 'E' option didn't work on RTE-6/VM with a subroutine

call.

SOLUTION: The software has been corrected.

KPR 2200009118

PROBLEM: When calculating the square root of a complex number in

double precision versus single precision, principle roots returned by double precision are opposite in sign to those of single precision. Regardless of which principle root

is returned the two methods should agree.

SOLUTION: The software has been corrected.

KPR 2200014761

PROBLEM: FTN7X compiler would not write line numbers (of original

source) greater than 9999 into list file. Lines > 9999

are labelled ?? instead.

SOLUTION: Line numbers above 9999 are printed as a MOD of 10000.

KPR 5000004952

PROBLEM: If an ENCODE or DECODE was tried with the buffer in

COMMON, and the buffer was not the first entry in the

COMMON block, the program aborted.

SOLUTION: The software has been corrected.

KPR 5000011346

PROBLEM: Assigning a value to a substring of a character array

failed in CDS mode. The following example failed:

\$CDS ON

program bug integer calls(2)

character \* 80 linea(2)

data calls /21,26/

i=1

linea(i) (calls(i):calls(i)) = 'x'

end

SOLUTION: The software has been corrected.

KPR 5000012047

PROBLEM: Fortran subroutine got a "\*\*\* PLEASE REPORT TO HP\*\*\*"

error after a syntax error was found.

SOLUTION: The software has been corrected.

KPR 5000014118

PROBLEM: When a scratch file of ACCESS='sequential' was created,

followed by a scratch file of ACCESS='direct', there was a runtime error of 460: 'an OPEN specified direct access;, but the file to be opened was sequential access (not 1 or

2 file type)

SOLUTION: The software has been corrected.

PROBLEM: When the compiler purged its scratch files, it did not use

the full path name, so if a WD command had been done during the compilation, the purging process would generate

an error.

SOLUTION: The compiler now uses the full path name of the scratch

files.

PROBLEM: In WRITE statements, when the data could be output only by

adjusting the format (e.g., reducing the number of decimal places), it would sometimes adjust and sometimes not (when

not, it would print stars).

SOLUTION: The compiler now always adjusts the format.

PROBLEM: INCLUDE'ed symbols were printed in the cross-reference

without the '+' if the symbol was only referenced once.

SOLUTION: The software has been corrected.

PROBLEM: Bad code was generated when an EMA call-by-reference

parameter was passed to a character function.

Software Changes (92833A)

SOLUTION: The software has been corrected.

PROBLEM: An error 32 was erroneously generated when a line had only

a 'D' in column one (no other text) and the source was

compiled with the 'D' option.

SOLUTION: The software has been corrected.

PROBLEM: If the compiler ran out of symbol table space while

compiling a DATA statement, it could generate a spurious error. This would occur before the symbol table overflow

error.

SOLUTION: The software has been corrected.

#### 2.8.3 Notes

None.

#### 2.9 (92857A) Basic/1000C

#### 2.9.1 Enhancements

ENHANCEMENT: BASIC/1000C underwent massive changes in order to support the matrix statements, new file system, and to have the compiler emit CDS code.

#### 2.9.2 Problems/Solutions

#### KPR 2200006965

PROBLEM: The PLIST command in the Interpreter appears to use the

first character of output for carriage control. This is

only a problem on the A-series.

SOLUTION: The HPIBU module was changed so that the text does not

appear as a control character to the line printer.

#### KPR 2200000372

PROBLEM: If many variables were accessed in a program unit before

their declarations, the BASIC compiler would report

'null index' error and abort.

SOLUTION: The compiler has been corrected to handle this situation

properly.

KPR 2200000448

PROBLEM: The STOP statement did not work if it was declared in a

function in a compiled program.

SOLUTION: The STOP function is now operational from functions as

well as subprograms.

KPR 2200000612

PROBLEM: When there was an error concerning the display device in a

subprogram, the default condition of the user terminal

would not occur at run-time.

SOLUTION: The display device default now works in subprograms

properly.

KPR 2200001420

PROBLEM: Program units which contain calls to routines that are

aliased to the same name are not accepted by LOADR or MLLDR. These loaders would issue an illegal relocatable

error.

SOLUTION: This problem was caused by the compiler emitting two

identical ENT's for the same name. The compiler has now

been corrected to emit the name just once.

KPR 2200002089

PROBLEM: If a string array element is the right-most variable in a

multiple string assignment, a compiler error 1612 would

occur.

SOLUTION: Multiple string assignments, including those involving

elements, now can be compiled successfully.

KPR 2200005827

PROBLEM: If ON ERROR was in effect with the response routine being

a subprogram and the current program unit was nested within that response routine and an error occurred, the error reported was a recursion error. This was correct, but the line number was that of the statement that initially caused the error, not the line number of the ON ERROR statement that had the erroneous recursive response

CALL.

SOLUTION: In the process of adding CDS support, the line number

reported is now correct.

KPR 2200007211

PROBLEM: When making an attempt to pass a non-EMA parameter to an

EMA parameter, a "COMPILER BUG" error would occur at

compilation time.

SOLUTION: An error stating that the types do not match is now

issued.

KPR 2200007237

PROBLEM: The specification of an LU with a secondary address in an

ASSIGN statement was not parsed properly in the compiler.

SOLUTION: Secondary addresses are now accepted by the compiler in an

ASSIGN statement.

KPR 2200008516

PROBLEM: If a SUBEXIT statement was issued outside of a subprogram

unit, the compiler would VM or DM.

SOLUTION: An error message informing the user that a SUBEXIT

statement cannot be outside of a subprogram is now being

issued.

KPR 2200009316

PROBLEM: As of the B.83 version of the RTE-A operating system, a

compiled BASIC program that utilized HP-IB statments and had the ASSIGNing of the LU to a constant, would issue a run-time error of 73 (I/O specifier not allowed with HP-IB

statement) when the HP-IB statements were referenced.

SOLUTION: The .OPSY value for RTE-A was changed at B.83. The compiled program checks this value only for HP-IB

statements and would, therefore, not agree. The check has been changed to compare the .OPSY value of RTE-6 only and assume that the OS is RTE-A if that comparison does not

agree.

PROBLEM: If an interpreted BASIC main routine called a compiled

BASIC string function, the function did not return the

appropriate results.

SOLUTION: A new parameter option was added to BBMG and BCALL to

allow the user to specify that a fixed string parameter is being passed. This change was noted in the Reference

manual.

2.9.3 Notes

NOTE: The BASIC interpreter, compiler, and compiled programs require the use of the 2401 version of the Pascal run-time

libraries. Therefore, for 2401 release of BASIC, two pascal libraries will be provided with the BASIC product. The following five install files were changed to copy the PASCAL.LIB and PASCAL CDS.LIB from the BASIC directory to

the /LIBRARIES directory.

INSTALL A BAS.CMD INSTALL 6 BAS.CMD INSTALL 6.CMD INSTALL A.CMD A92857.SNF

NOTE: Since the LINKer supplied with RTE-A and RTE-6 has been updated as of C.83, there is no longer a need to supply it with the BASIC/1000C Product. Therefore, it has been deleted.

NOTE: The file names for the entire BASIC product were changed in order to take advantage of the new file system structure.

NOTE: Some libraries increased in size due to the addition of the new features. This required a break-up of:

- RLIB3.LIB into RLIB3.LIB and RLIB4.LIB
   CBASIC.LIB into CBASIC1.REL AND CBASIC2.REL,
- (3) CBASIC CDS.LIB into CBASIC CDS1.REL and CBASIC CDS2.RE
- 2.10 (92860A) Symbolic Debug/1000

#### 2.10.1 Enhancements

ENHANCEMENT: Symbolic Debug has been enhanced to allow debug of Pascal and compiled Basic/1000-C programs.

ENHANCEMENT: The software has been enhanced to allow the user to to display (but not modify) the program counter via 'D [p]'. Attempts to modify P elicit a warning.

ENHANCEMENT: Created one routine to clear all breakpoints.

ENHANCEMENT: 'W' failed to show names of library routines. One just got an octal number. DSPOT would do this for any module lacking line number info, even though the module name was easily known. DSPOT now always shows the module name, with an octal address rather than a decimal line number if the module has no line number info. It also will put "??" as the name if it cannot find the name.

ENHANCEMENT: Debug's main has been enhanced to share duplicate data rather than having its own. This involved the creation of a common block: USEFUL CHARS.

ENHANCEMENT: CPARE has been enhanced to use a table in common rather than its own table.

ENHANCEMENT: Split the 4000+ lines of the source SINIT up into pieces for easier handling.

ENHANCEMENT: CombineD CheckCDS, DNLevel, SetCDSSegBreak, ClearCDSSegBreak, Was\_OverLaid, and Is\_Entry\_Number into a macro routine to reduce codespace. CheckCDS must return, the rest should report an error and terminate Debug via a call to DnitD. Saved 15 words in the main.

#### 2.10.2 Problems/Solutions

KPR 2200002550 and KPR 5000009225

PROBLEM: DEBUG could not single step DLOG because the variable GotThisFar wasn't being saved properly in STEPB.

SOLUTION: RealGotThisFar is used to save the first occurrence of a non-steppable instruction, and is assigned to GotThisFar upon exit from STEPB.

#### KPR 2200002782

PROBLEM: DEBUG could not talk to 2640B terminals because the length of the status returned was tested against 9 bytes when its length is actually 8.

SOLUTION: The software has been corrected.

KPR 2200004341, KPR 2200005660, KPR 2200030056, and KPR 2200030064 PROBLEM: DEBUG failed to pass RMPAR parameters to the program being debugged.

SOLUTION: A new run string option has been added. When a '+P' appears anywhere between DEBUG and the target program name, Debug will NOT modify the parameters in any way, but will just pass them on to the target program.

#### KPR 2200003939

PROBLEM: DEBUG failed to display REAL\*4 as a character array correctly because GETVL and GETVAR seemed to think the size of an element was one word.

SOLUTION: Changed DOSUBSCRIPT to pay attention to subscripts when determining the size of an element.

KPR 2200030106

DEBUG MP's when attempting to use the step trace command PROBLEM:

with a range because segment DEBU1 was aborting, while

executing in SSTEP.

SOLUTION: The software has been corrected.

KPR 5000006346 and KPR 5000009183

PROBLEM: The user program ran to completion while single stepping a

large CDS program after the first 'S' command.

SOLUTION: The software has been corrected.

KPR 5000008540

PROBLEM: A histogram for non-CDS routines in a CDS program was

> reported as using 100% of the CPU on the first line of the routine. HISTOGRAM was setting CODEMR to 4 if CouldBeCDS was true, ignoring the possibility that one could execute old code, which has an MR of one. PLOTLOCATION failed to check if CURRENTSEG was zero, which means that the address

is in data space.

SOLUTION: PLOTLOCATION sets CODEMR to one if CURRENTSEG is zero, as

of A.84.

KPR 5000012963

Debug used calls to EXEC, and REIO, using the one-word PROBLEM:

> integer global TRMLU as the LU number to communicate with for all its IO. These calls would not accept LU numbers

greater than 65.

SOLUTION: Replace all calls to REIO with calls to XREIO, and the

appropriate calls to EXEC with XLUEX, and change TRMLU into a 2-word integer, and set up the appropriate bits in TRMLU. Note that BLDDB need only know about LU 1, the terminal screen, and none of its modules have been

changed.

PROBLEM: DEBUG was reporting an internal error in response to: This

occurred after DISP called PREPER with the address returned by GETVAR. When GETVAR failed, it returned either a negative error number or some huge address, which

did not correspond to any defined error number.

SOLUTION: DISP now tests for such a number, and passes a -1 if this is the case. This causes an "address out of range"

message to appear, as it should.

PROBLEM: DEBUG thought a valid Pascal pointer was NIL. The user

program was compiled with the \$HEAP 2\$ option, so all pointers were 2 words long. However, the VM option was omitted from the LINK command file, so the high order word

was always 0.

SOLUTION: GETVAR now checks both words. The pointer is NIL only if

both words are zero.

PROBLEM: Pascal CHAR variables could not be modified because RDVAL

was ignoring the type of these items.

SOLUTION: RDVAL now handles this Pascal type.

PROBLEM: The DEBUG information file left was open after

termination. CLEANUP was closing the information file only if SNEW was true, which means BLDDB had been

scheduled to build the symbol table.

SOLUTION: Close the file regardless of the value of the global SNEW.

PROBLEM: '? \*' gets non-specific response. The error message file

had nothing to say about comments.

SOLUTION: Help information for the comment command has been put into

the debug error message file.

PROBLEM: An error 56 would occur if the where command, 'W', was in

a Pascal main. BTRACE looked at the "segment" name of the

main, which, for Pascal, was incorrect.

SOLUTION: The software has been corrected.

PROBLEM: DEBUG was ignoring breakmode 'BR' command. CONT calls

IFBRK before calling NEWSG, which checks for segment switches. If the break flag was set, AND there was a segment switch, then the segment switch would not be

noted.

SOLUTION: CONT now calls NEWSG before IFBRK, so the segment number

is correct.

PROBLEM: MP violation reported as error 20. In CONT: newnode <>

-1, SWICH fails, GTEMP is true, but found is false, so CONT fails to call HANDLE\_VIOLATION. There is a GOTO 999 in the THEN clause having the comment: "YOU'RE A DEAD

DUCK".

SOLUTION: Deleted the GOTO 999.

PROBLEM: DEBUG was stepping into the LAST line of a routine because

SSTEP passed .true. instead of .false. to MCONT in the

95117 loop.

SOLUTION: SSTEP PCALA now passes .false.

PROBLEM: The FMPSETPOSITION call in FIND reports that DDDCB is not

open. This is because that DCB is being used by the

profiler for its data file.

SOLUTION: 'F' command is now documented as being illegal in overview

mode.

PROBLEM: 'D Ob:10' and 'D 2b:8' failed to agree. The values peeked

at and returned by DOPOK were picked up from different locations. Any location that resolved to either address 0 or 1 (the A or B registers) caused DOPOK to peek at the ID

segment, not at the user program's memory.

SOLUTION: If the repeat count is greater than 1, peek at memory, not

the ID segment.

PROBLEM: 'S' on Pascal CASE statement caused the user program to

run to completion when single stepping a Pascal CASE statement. The compiler used a JMP 0,I instruction to implement a jump table. The single stepper would not enter hipboot mode in such instructions, where the register will probably have an incorrect value until just before the instruction is to be executed. STEPB failed to return -1 when such code was encountered. STEPB should return the address of the first instruction that it could

not handle and hipboot mode should take over.

SOLUTION: Any indirect jump via a register gets hipbooted.

PROBLEM: Display of heap 2 pointer to a string fails. RPEEK, when

called from Pascal\_STRING, gets the string header from EMA without a problem, but sets EMAValid to false, causing

subsequent calls to RPEEK to look in non-EMA.

SOLUTION: GETVAR resets EMAValid to true so RPEEK, when called from

DISP, will again look in EMA for the string buffer of

characters.

PROBLEM: Several routines use their own local data for register

names.

SOLUTION: The software has been corrected.

PROBLEM: 'O' command, when an OVR file already exists, gives you a

prompt to purge that file. Any non-affirmative response

gets error 110, followed by "Save profile data [n]?"

SOLUTION: The software has been corrected.

PROBLEM: Goto command was not listed when '?' entered. Error

message file wrong.

SOLUTION: The software has been corrected.

PROBLEM: If no dot or arrow was found, then GETVAR would try

calling GETVL again.

SOLUTION: Now GETVAR only calls GETVL if such a character was

actually found.

PROBLEM: Need only one load command file for BLDDB because there is

no difference between them.

SOLUTION: The file #BLDN6 was replaced by BLDDB.LOD.

PROBLEM: SWICH needs to be told whether or not to clear the screen screen when a new module has been entered. This is needed now because we always must step into PCALX/V's, then look around to find out if this new module is !GOTO or !ARTN or

not. We want to do this quietly.

SOLUTION: Another parameter, BENOISY, is now passed, and it only updates CMODNN if the new module has line number info.

PROBLEM: DEBUG would fail to stop at a set breakpoint when performing 'P' command.

SOLUTION: The software has been corrected.

PROBLEM: Extents on type 1 debug file can grow huge because BUIL1 added 24, instead of 32 to the FS variable.

SOLUTION: The software now adds 32.

PROBLEM: Need a way to graphically display what is in the symbol

SOLUTION: A new segment DEBUX has been added.

PROBLEM: REPER and PREPER did not share their display buffer and this would sometimes cause the display to become garbled.

SOLUTION: They now share ENTRY points with one routine: Report Error.

PROBLEM: Since Profile and Histogram overlay the BREAK tables with overview data points, it turns out that NewSg cannot clear breaks left over in other CDS segments very well.

SOLUTION: Merge DEBU4 and DEBU8 into one segment, allowing a new common block called PROFILE DATA to be shared between the overview routines. This also recovers the 10 words of segmenting overhead in the main.

PROBLEM: Using the 'S' command on Pascal CASE statement would cause DEBUG to loop. CDI in DEST6/L NEVER handled peeks to the A or B registers correctly when in CDS mode. It needed to check that BODY was greater than 1 (the reference was through one of the registers) when checking if the MR should be the passed in MR (which was 4 for code) or 1 for data. The registers are in data, so the MR should be forced to 1.

SOLUTION: The software has been corrected.

PROBLEM: 51 breakpoints could be set which was one over the limit. SOLUTION: Updated the master file for the test.

PROBLEM: DEBUG was running out of memory in the main. The breakpoint tables comprised six tables of 50 words each.

SOLUTION: Since it was determined that 25 break/tracepoints would be

more than necessary, Debug now allows only that many. This increased the size of free space by over 150 words. Also made an include file for the common and data for the breakpoint tables, combining the BREAKPOINTS and SEGS common blocks. Add a global variable with a value equal to the maximum number of breaks allowed.

PROBLEM: Declarations of the same items in common by different sources may not match.

SOLUTION: Use an include file to "import" shared data. This would insure that there is only one place where a declaration resides.

PROBLEM: On 2621 terminals, the display showed twice the characters requested because RDREC was not negating the length passed to it.

SOLUTION: RDREC negates the length as of A.84.

PROBLEM: DEBUG would go into an infinite loop when stepping into a call to a direct, nested, routine.

SOLUTION: The software has been corrected as a side effect of the other changes to the single stepping processors.

PROBLEM: When the target program name was entered in the run string without the RUN type extension, PROFILE (formerly OVER) would use the "=" prefix, instead of the ".OVR" suffix.

SOLUTION: As of A.84, DEBUG uses the new common variable SAVEDUNAME, instead of UNAME, on which to base the profile data file name.

PROBLEM: DEBUG would display "Can't single step" message when a 'S
I' request was entered at the END of the last invocation
of a recursive routine.

SOLUTION: The software was corrected due to another change to WHERE.

PROBLEM: The Pascal scope rules were not obeyed when displaying non-local variables. The subroutine WHERE was calling GENT, thinking it would return the address of the first line of the module.

SOLUTION: WHERE now calls GFL.

PROBLEM: DEBUG's 'W' command was off by one segment in large, CDS program because the symbol table was getting the segment number wrong.

SOLUTION: Fixed BILDS to process segment records properly.

PROBLEM: Pascal or BASIC strings were not displayed correctly with the 'W' command. PDUMP was not calling GETVAR to process the parameters. It was doing its own processing with duplicate code.

SOLUTION: PDUMP now calls Pascal STRING and BASIC STRING.

PROBLEM: Could not display non-local variable in CDS code. This was caused by DNLEVEL using the low address of the enclosing, level 1 routine as the low bound with which to

search the activation records for the locals of a more

deeply nested routine.

SOLUTION: The software has been changed to use the address of the first line of code, which more accurately reflects the

bound of the activation record in the stack.

PROBLEM: DEBUG would wind up at the Pascal END statement after

stepping into the routine. STEPB was probably setting a break at the entry point of the Pascal routine, not the

first line.

SOLUTION: STEPB now sets the break at the first line.

PROBLEM: Spurious and temporary breaks were left at octal

addresses. SSTEP was confused as to where he was, and failed to call KNOCKEMDOWN after arriving at the

destination.

SOLUTION: SSTEP calls KNOCKEMDOWN correctly.

PROBLEM: Conditional break using Pascal or FORTRAN string variables

failed. BCHEK was not checking if the item conditioned on was a string. CPARE was not handling Pascal string types.

SOLUTION: The software has been corrected.

PROBLEM: A garbage character remained in runstring passed to target

from Debug. DEBUG, in DO\_RUN\_STRING, deletes several parameters from the original run string, and passes the remainder to the target via an EXEC call. If the remaining string was of an odd length, an extra character would be passed by the operating system, but the length would be correct. However, the target could still see the

extra character.

SOLUTION: DEBUG now blanks out the odd character.

PROBLEM: Displaying the address of strings with 'D \s' would cause

GETVAR to return the address of the header, not the

characters of a string.

SOLUTION: GETVAR now returns the address of the first character.

PROBLEM: Using the command 'S I' at a call to the Pascal NEW

procedure would produce errors 85 and 20 because DEST

failed to distinguish between the 5 types of PCALs.

SOLUTION: DEST now tells its caller which PCAL it had, and STEPB

pays attention to it.

PROBLEM: The '0' command wouldn't accept a carriage return as an

affirmative response. PROFILE (formerly OVER) was

checking the response character and length incorrectly. SOLUTION: It now checks if the character is either "Y" or "y" or if

the length is zero.

PROBLEM: Starting at last line of program (END statement), STEPB

SSTEP calls CONT via MCONT, who says KNOWN is true. We actually want to call ATOL, to see if there is line number

information. This affects PCALX/V's only.

SOLUTION: The software has been corrected.

PROBLEM: Error 21 on "D dataname/compo" occurred when in READINPUT.

GETVAR, when testing for the item's accessibility, looked

at MAINHIGH, which, for CDS programs, is zero.

SOLUTION: GETVAR now checks CDSON.

PROBLEM: 'S' after 'T' or conditional break gets garbage and 'B'

repeats itself. A "Valid = .false." check had been

accidentally deleted from BCHEK.

SOLUTION: The software has been corrected.

PROBLEM: '? H' gets non-specific response when in Overview mode.

SOLUTION: Error message file was corrected.

PROBLEM: An MP violation occurred single-stepping CDS program with

one code block, three segments. NEWSG was peeking at 2000B, instead of 2001B. It also must call SETCDSSEGBREAK when in the current segment, so DEBUG is told when that

segment is mapped back in and the breaks can be restored.

SOLUTION: The software has been corrected.

PROBLEM: Step In at call to Pascal RESET and DEBUG would get lost

in the routine RESET in an unknown place in segment 2. The 'S I' command was entered at a call to RESET in segment 1. Since the call was a PCALX, debug had to step in, then look around. It could not get back. GFL, called from SSTEP PCALA, returned a reasonable number, even though there was no line number info for Pas.ResetFile.

SOLUTION: The software has been corrected.

PROBLEM: Breakpoint set at first line of a Macro routine, NOT the

entry point+1. Another fix broke this in GFL. GFL really

does need to call ATOL.

SOLUTION: Fixed GFL.

PROBLEM: "H fmpaskddot" gets error 20, but doesn't identify the

module. Error number passed to REPER was wrong.

SOLUTION: The software has been corrected.

PROBLEM: The DEBUG 'W' command got error 56 when in the main but reported the location was all right. BILDS in BLDDB was setting the length wrong in the segment name table. The name was correct, however. BTRAC (called WCOMM), used

name was correct, however. BTRAC (called WCOMM), used this length. Pascal main names can be 16 characters long, but the segment name (faked out by BILDS) has a length of

no more than 5.

SOLUTION: BTRAC now also compares the first 5 characters.

PROBLEM: All Heap 2 (Pascal) pointers are claimed to be nil, when

they're not. GETVAR only tested the first of the 2-word

pointers being zero.

SOLUTION: It now checks the entire 2-word quantity.

PROBLEM: Error 94 at startup: "Can't find main programs debug info." The main of Pascal program does not always

"enclose" its level 1 routine; it is just another level 1 module. WHERE and WHERESLAVE fail to set up an entry in the LEVELS array for the main in this case. Now that Pascal sets LIBRARY and VISIBLE on, this is always the

case.

SOLUTION: A new global, MAINLOCALVARHEAD, to save the pointer to the

local variables tree for the main was created. It is sort

of a zeroth entry in LEVELS.

PROBLEM: Errors 85 and 134 when attempting to single step ISHFT

occurred. SSTEP called SETEMUP and KNOCKEMDOWN passing the globals CURADD, POSMR, and SEGNUM (which are in common). These 2 routines expect 3 ARRAYS of addresses, MRs, and segment numbers. The second routine zeroes out the first array. Consequently, POSADD, a very important

state variable is lost.

SOLUTION: Replaced those 2 calls with calls to SETB and CLEAR.

PROBLEM: Had to do two GOTO commands to a Pascal label to finally

get there because DLINE was changing the line number to be

displayed.

SOLUTION: DLINE has been fixed.

PROBLEM: Debug should have a new time stamp for each change made to

the code. This value will be displayed upon start-up.

SOLUTION: A new source, DBREV, holds the time stamp.

PROBLEM: Target program loops on "P 1014/readinput" command.

SETCDSSEGBREAK was copying the PA bit to the AB bit. This

would cause a segment load each time.

SOLUTION: The software has been corrected.

PROBLEM: An error message prevented completion of 'W' command

output because REPER would overwrite the display buffer.

SOLUTION: REPER and PREPER now both share their own message buffer

and other code. PDUMP now shows what had been gotten so

far, then calls PREPER.

PROBLEM: BLDDB created extents on the type 1 file if the type 3

file was crushed (i.e. extents eliminated and empty space at the end of the file truncated). The initial open of the type 1 file by BUIL1 calculated its size based on the

size of the type 3 file size.

SOLUTION: The formula has been changed to call truncate at the end.

PROBLEM: Cannot display or modify globals when not in the main.

The LEVELS array had no entry for the main, when the main was just another level 1 routine, as is the case for libraries. This would cause GETVL to fail to find the

module for the global.

SOLUTION: New global common: MainLocalVarHead points to the local

variable head of the main's local variables, which are the

globals in the program.

PROBLEM: ENTs and EATs (entry tables and entry address tables) have

duplicate entries for module HTEST in the symbol table If a module has no XENT record, then BILDS will dummy one up via MakeSureEnt. This routine used MESSAGEHENT instead of HENT for the head pointer to the ent nodes. Also,

ProcedureExit was being called before MakeSureEnt.

SOLUTION: BILDS now calls ProcedureExit first, and MakeSureEnt now

uses HENT.

PROBLEM: Display of packed array of char (PAC) always shows full

array. DOSUBSCRIPT was not checking if a subscript had

been given.

SOLUTION: The software has been corrected.

PROBLEM: Can step into a routine that has no debug information.

SOLUTION: Now the user will get a message, and be prevented from

stepping into the routine.

PROBLEM: No histogram was generated for routines with less than 3%

of total time. UserAddr in PlotLocation is the address of the first line, which, for Pascal, should be the low

address, not the entry point address.

SOLUTION: If UserAddr < low, then low = useraddr.

PROBLEM: DEBUG would loop when trying to display an array of

enumeration.

SOLUTION: BILDS now calls Fix Array for arrays of enumerations and

other complicated types.

PROBLEM: DEBUG reported an address out of range on heap 1 Pascal

string because LSIZE in DoSubscript was wrong.

SOLUTION: The software has been changed so that LSIZE is really the

element size.

PROBLEM: 'M' command with no second argument assumed zero for the

second argument, which is unfriendly.

SOLUTION: MODIF will now say the second argument is a bad value, and

not modify anything.

PROBLEM: Wrong error message and missed error displaying due to

multi-dimensioned array off-by-one problems in AREF.

SOLUTION: The software has been corrected.

PROBLEM: DoSubscript couldn't handle anything smaller than a word.

SOLUTION: DoSubscript and WrVal, both use WhichByte and WhichBit now

have been enhanced.

CS06 violation after 52 'S' commands in multi-segmented PROBLEM:

CDS program occurred. There was a CLEAR LATER break at "4", an entry number. When NEWSG wanted to clear it, it had not been converted to its corresponding entry address. So a break was "cleared" in the base page or

segment transfer table.

Temporary breaks for PCLAX/V's that never get set remain SOLUTION:

as entry numbers. Check if it is still such an entry number in CLEARB, and, if so, don't poke, just delete it

from the tables.

PROBLEM: BASIC emited no information relating to arrays, due to the

> fact that they use dope vectors to access the array. Since it was not planned that Debug ever know about dope vectors, all that is emitted by BASIC is the starting address. This means that arrays whose element size is 1

word, and which are based on 1, not 0, can be displayed.

SOLUTION: The software has been corrected.

Histogram of unexported, level-2 routine in Pascal MODULE PROBLEM:

failed.

SOLUTION: The software has been corrected.

PROBLEM: Discontinuous extents were created in the debug file by

> BLDDB. The formula used to figure a size for the type 1 debug file was based on the size of the type 3 version of

that file. This formula was not good enough.

SOLUTION: Formula is now (1.5 \* type 3 size) + 32. 32 blocks are

for the private swapping file, which contains the command

stack and breakpoint tables.

PROBLEM: BLDDB no longer echoed segment and nested routine names.

TRMLU was redeclared as an integer\*4 and BILDS was using a simple EXT which would get only the first word, which was

zero.

SOLUTION: Fixed the declaration in BLOCK.

PROBLEM: The user program ran to completion when single-stepping

contents of the THEN clause. There were over 500 current-page links dropped by LINK in this CDS routine just after the code for the line in question. STEPB and

SSTEP failed in lines like this.

SOLUTION: SSTEP now reports that it cannot single step such lines.

PROBLEM: Unable to access hidden, static, variables declared in a

Pascal MODULE. GetField, called by everyone, would check if the address of a symbol was an EMA address by checking if that address was less than zero. If it was, then it bumped the offset into that node by one. The nodes for the hidden space of a Pascal MODULE got an address of

-32768. Thus GetField would return the wrong field.

SOLUTION: GetField now checks the MR, which will be 5 for an EMA

address.

PROBLEM: 'W' should give the names of undebuggable modules, not

just an address.

SOLUTION: DSPOT now gives the names.

PROBLEM: Message 70 should use the word "update", not "access".

Debug did call FMPUPDATETIME as it should.

SOLUTION: The error message has been fixed.

PROBLEM: The breakpoint location given was wrong, i.e., "0/??" made

no sense. DSPOT was testing STPTR at the wrong time.

SOLUTION: The software has been corrected.

PROBLEM: Single-stepping over a line with a tracepoint did not

perform the trace. SSTEP in segment 1 called MCONT with an expression as the parameter whose value resided at 62575B. This temporary got clobbered when BCHEK (called from CONT) loads segment 2 to call DISP on the trace

variable VALG as requested by the user.

SOLUTION: CONT now saves that parameter (BeNoisy) in a local (dummy)

and restores it after the call BCHEK after the second call

to USER RAN near line 297.

PROBLEM: SSTEP is too large as a single routine. Using common

would reduce use of parameters. .justify

SOLUTION: The software has been modified.

PROBLEM: Several routines duplicated code. SOLUTION: Calls are now shared to Add\_Place.

PROBLEM: The CRAM routine was duplicated in both sources DEBU2 and

DEBU5.

SOLUTION: The CRAM routine now resides in its own source file.

PROBLEM: Add\_Place was setting duplicate breakpoints when

single-stepping the jump of some Pascal CASE statements.

SOLUTION: It no longer duplicates them, but one can still exceed the

limit of 20 places.

PROBLEM: The global fmpCmodf was not being used by DEBUG or BLDDB.

It was 32 words of data that never got used.

SOLUTION: The global has been removed.

PROBLEM: The default response to request to purge old overview data

file was wrong. Several GOTOs were incorrectly arranged

in OVER, near labels 10 and 15.

SOLUTION: Rearranged code to be correct.

PROBLEM: The common block SAMPLE was globally shared between DEBU4

and HISTOGRAM. This took up 128 words in the main.

SOLUTION: Have those 2 segments use the breakpoint tables for this

data.

PROBLEM: Can't use breakmode when Debug is processing an include

file because GetCM in DEBU1 never called IFBRK, it just

read the next line.

SOLUTION: GetCM now calls IFBRK when it tests the length of the line

just read.

PROBLEM: PrepUser in both PREPL and PREP6 called the same routine

(SETRMPARMS). Need to avoid duplicate code.

SOLUTION: PREPUSER now has its own source.

PROBLEM: Histogram reports 0% for both "System Noise" and "Other

(known code)". Plot1 in HISTOGRAM would calculate this percentage, and call PrintLine, which never tested its

input parameters.

SOLUTION: PrintLine now returns if NSTARS is zero and isn't

reported.

PROBLEM: RMPAR parameter passing worked only if the first parameter

was a power of 2. Set Rmparms was testing Pbuf (1)

instead of Pbuf (3).

SOLUTION: The software has been corrected.

PROBLEM: MODIF in DEBU5 calls PREPER when the variable on the right

side was invalid. It was using SCOL as the column to point at. This caused the "^" on error messages to point

at the wrong place.

SOLUTION: Use SSCOL instead of SCOL.

PROBLEM: Common blocks BREAK, SEGS, EDCB, TRMLU, TTAB, WSIZE, and

DBINST are not used. BTEXT is never called; FMPNAMR, declared in the main, is called only from segment zero; OUTRC gets its own source, as it's used only in segment two. Use a new source to contain only the DATA declaration for the current version of BLDDB, just like

DBREV for Debug.

SOLUTION: Deleted the common blocks and BTEXT; FMPNAMR loaded only

with segment zero; OUTRC loaded with segment two. This saved 944 words, allowing two more 512-word swapping chunks of free space, for a total of 42. The new source

is source/bdrev.ftn.

PROBLEM: The debug info file can be full of unused space.

SOLUTION: Insure that there is none. Truncate the file, using the

global RCNT to calculate the block count of real data in

the file.

PROBLEM: The flag PLEVEL was not being passed to Debug from BLDDB.

SOLUTION: BLDDB now returns this value via the PRTN call in

TERMINATE.

PROBLEM: BUILO was testing the wrong thing to determine if the

target program resided on a FMGR cartridge or a new file

system directory.

SOLUTION: It now uses a flag: IS NEW FILE.

PROBLEM: 'C \*' left breaks in other CDS segments, causing MP

violations. CCOMM simply looped across the BREAK tables, called POKE to clear the break from the user's code, and cleared out the BREAK tables. It was not calling CLEAR.

SOLUTION: CCOMM now calls the function CLEARED ALL.

PROBLEM: NewSg, when clearing breaks listed in the Clear\_Later

breakpoint table, was not accounting for the fact that CLEARB packs that table. So, some breaks were not

cleared, and the program would MP.

SOLUTION: This is in the last loop done by NewSg. Use the local

TIMES to fix up I, which picks the correct index into the

table.

PROBLEM:

'O file' gets prompt for verification, but ignored the file name given. Debug faked out a 'C \*' command to clear all breaks before calling Profile by setting CLEN to 1, thus losing anything after the 'O' part of the command.

SOLUTION: Debug now saves and restores the real CLEN.

PROBLEM: Overview mode fails to clear breaks remaining in other CDS

> segments. Profile calls OVNewSeg, which didn't handle CDS segment switches. Only NewSg handles clearing breaks left

in other CDS segments.

SOLUTION: OVNewSeg now calls NewSg.

Debug should pass 256 characters of run string to the PROBLEM:

target program. The current limit was 80 characters, which was not enough when the user has the new file system (file names can be much longer than 40 characters), and

was debugging the target program programmatically.

SOLUTION: It is now 256.

'W' gets octal address, not line number in small CDS PROBLEM:

> routine. Fline, called by Dspot, loops 39 times, calling AtoL, trying to map an address to a line number. It tries address-1, then address-2, to address-39. The line ahead of the current line at the time the W command was given

had 43 instructions in it, so 39 was not enough.

SOLUTION: Fline now loops 100 times.

PROBLEM: CONT always returned .true. when it had switched in a

module in another segment that had no debug info.

SOLUTION: It now returns .false. for such modules.

When in overview mode, the '?' command said both "Help" PROBLEM:

and "Histogram" were valid. The error message file didn't say to use '?' to ask for help while in the overview mode.

SOLUTION: The software has been corrected.

The '?' within overview mode incorrectly stated that the PROBLEM:

FIND command was valid.

SOLUTION: The help file has been corrected in A.84.

Sstep\_Pascal\_CASE increments subscr by 2, to skip a PROBLEM:

> possible data word following the JMP 0,I instruction. This headed up the jump table emitted by the Pascal compiler which caused DEBUG to "get lost" if the first

case label was taken.

SOLUTION: It now increments subscr by 1.

#### Software Changes (92860A)

PROBLEM: Debug passes an extra runstring character to the target

program. When DEBUG was enhanced to pass 256 characters, The call to BFILL in Do Run String still passed only 80,

not 256.

SOLUTION: The software has been corrected.

PROBLEM: DEBUG purged the overview data file even when the user

said not to. Cleanup Overview was checking things wrong.

SOLUTION: The software has been corrected.

PROBLEM: Attempted to allow breaks to remain when one sets a

tracepoint at the same location as the break, but, this broke several other things. SetEmUp passed .false. for

DontShoot.

SOLUTION: SetEmUp now passes .true.

2.10.3 Notes

None.

+	++
CURRENT SOFTWARE REVISIONS & CHANGES	CHAPTER 3
	1
+	++

This chapter lists the current revision codes for each software product, and notes any changes that have occurred to the product in this update cycle.

Those products that have been changed in this update cycle are marked with a '+' to the left of the product number. If a product has been updated, the listing will also include:

- a) Manuals and,
- b) Software (and firmware) media

that have been updated (or added) in this update cycle, and are being distributed with the subscription services for this product.

If software has been updated for the product, then those modules that have been changed/added/deleted are marked with a '\*' to the left of the file name, and the type of update is shown to the right of the current revision code: updated files show the new revision code; added or deleted files are marked as 'New' or 'Deleted' (respectively).

There have been some changes to the format of this chapter because of the new hierarchical file system on RTE-A and RTE-6/VM. At this update, some products will be shipped in TF format. The files will be in a hierarchical structure with global and subdirectories. Also, individual file names can be up to twenty-one characters long (including the dot). To accomdate this, two changes have been made.

- The file name field was expanded from six characters to twenty-one. To accomodate this, the module field was eliminated.
- For products that are shipped in the hierarchical file format, path names are given on a separate line to help identify where specific parts can be found.

#### Current Software Revisions & Changes

For specific information on updating systems in the new hierarchical file format, please refer to chapter 5.

Note that updated products may have only manual changes or only software changes. This is noted in the manual or media lists.

#### 3.1 (12824A) Vector Instruction Set

A600/A600+ VCP HISTORY

5180-0173 (U606) 5180-0174 (U706)

Original Release

Revision 4

5180-0189 (U606)\* 5180-0190 (U706)\*

\* Changed to fix bugs. Two power fails in quick succession may result in an incorrect autorestart. Booting remotely over FDL causes system to hang. Erroneous parity error message if memory is lost. Also several inconveniences are fixed and enhancements added.

Revision 6

(See S/N 12102A-01)

12102-80003 (U606)\* 12102-80004 (U706)\*

\* Changed to run with VC+. Also adds boot loaders for 1600 BPI Mag Tape, 3.5" Micro Floppy, and 10 MB mini-winchester disc. VCP size is 8K and resides in EPROM.

Included in 12107A A600+ Upgrade

(See S/N 2106AK-3)

Revision 4001

Kit.

5180-4253 (U606)\* 5180-4254 (U706)\* \* Changed to fix bug. If system disc and CPU are powered up simultaneously the CPU will not auto boot.

(See S/N 2106AK-6A)

Revision level 4004

GENERATION & INSTALLATION CONSIDERATIONS	i c	HAPTER	<b>4</b> і
	i		i
+	+		+

This chapter discusses both software and firmware considerations for generation and installation that have been introduced by the this software update.

#### 4.1 Software Considerations

The following are products that require changes to the generation or loading procedures. For detailed descriptions refer to the appropriate manuals for the product.

#### 4.1.1 (91750) DS/1000-IV

A new driver, DVB65, was created to improve SAM allocation. The driver recognizes two new subchannel types: 30B and 31B. NOTE: DVB65 is special and works only in specific network topology. See Section 2.2.1 and the DS/1000-IV Network Mangager's manual Volume 1 (91750-90010) for more details.

Two libraries were added: \$D3X25 AND \$D3N25. These libraries were added to correct error recovery problems. See Section 2.2.2, KRP 5000007344 for more detail.

### 4.1.2 (91751A) DSN/X.25 1000

The name of the LINK command files used to load the DSN/X.25 1000 product were changed to replace the "/" (conflict with the new file system) by a "\*". In addition, on the A-Series, the transfer file names were changed to reflect their use on RTE-A only.

#### 4.1.3 (92077A) RTE-A

Due to the increased size of the RTE-A operating system caused by the enhancements mentioned in chapter 2, the minimum 128k byte memory system is no longer supported.

Customers with Pascal/1000 (92833A) should check the configuration guide shipped with that product (CONFIG\_GUIDE.DOC, 92833-17085) to decide which Pascal library to generate into their system. Customers without Pascal should continue to generate \$PLIBN (92833-16054) as before.

The generation information for the 9133XV and 9134XV was left out of the System Generation and Installation manual. The default generation for the 9134XV is four LU's using Model name M9134X. The 9133XV is the same with the addition of on LU for the micro-floppy. An example of generating the 9133XV using default parameters follows.

\* Micro-floppy LU, HPIB Address 3
DVT,%DD.30,M7902,LU:lu,DP:1:3:0:0:0,DP:5:2:66:16:2
\* First Disc LU, HPIB Address 0
DVT,%DD.30,M913\perpxx:0,LU:lu,DP:1:0
\* Second Disc LU, HPIB Address 0
DVT,%DD.30,M913\perpxx:1,LU:lu,DP:1:0
\* Third Disc LU, HPIB Address 0
DVT,%DD.30,M913\perpxx:2,LU:lu,DP:1:0
\* Fourth Disc LU, HPIB Address 0
DVT,%DD.30,M913\perpxx:2,LU:lu,DP:1:0

### 4.1.4 (92833A) Pascal/1000

Pascal was enhanced to generate CDS code. The compiler itself is provided in both CDS and Standard versions. See the file CONFIG\_GUIDE.DOC (92833-17083) that is shipped with Pascal/1000 for more details.

The old pascal library \$PLIBN has been deleted. There are now two new libraries: PASCAL\_LIB and PASCAL\_CDS.LIB. See the file CONFIG\_GUIDE.DOC (92833-17083) for more details.

### 4.1.5 (92857A) Basic/1000C

Basic/1000C was enhanced to support matrix statements, the hierarchical file system, and compiler generated CDS code.

Three libraries increased in size and were required to be broken up as follows.

- (1) RLIB3.LIE into RLIB3.LIB and RLIB4.LIB
- (2) CBASIC.LIB into CBASIC1.REL AND CBASIC2.REL,
- (3) CBASIC\_CDS.LIB into CBASIC\_CDS1.REL and CBASIC\_CDS2.REL.

# 4.1.6 (92860A) Symbolic Debug/1000

To allow for more free space, Debug is now limited to a total of 25 break/tracepoints. See section 2.10.2 for more details.

#### 4.2 RP List for Firmware

This section will list the RP's for the HP/1000 M-Series, HP/1000 E-Series and the HP/1000 F-Series, and will specify which RP's are Operating System dependent. The following conventions have been chosen:

- ^ = Applies only to RTE-IVB and RTE-6/VM Op-Systems; it indicates that the specified RP does not need to be included in the Generation Answer File because it is part of the module RPLIB in the system library.
- + = Applies only to RTE-6/VM Op-System.
- = Applies only to RTE-IVB Op-System.

# 4.2.1 RP's for the HP/1000 M-Series

4.2.3 RP's for the HP/1000 F-Series
*****************
          ENTRY POINT CHANGES
          FOR THE HP/1000 F-Series
*****************
     The RP's in an F-series CPU are Op-System dependent.
     Conforming to the conventions specified at the beginning
     of this chapter:
                          indicates RTE-6/VM, and
                     "-" indicates RTE-IVB.

+					 	 	 	<b></b> -		 	 L					. <b></b> .	4

Customers on Support Services, CSS/SSS, will receive updates to software on paper tape, minicartridges, mag tape, flexible discs or CTDs, depending on the options they have ordered. This chapter contains information concerning the format of update media and suggested procedures for updating software from this media.

# 5.1 General Information

To update your software:

- 1. BACK UP YOUR DASC BEFORE PROCEEDING.
  This will insure that you can always return to your original system and start over.
- 2. VERIFY YOUR BACKUP COPY.

  It is suggested that you make two copies and verify them both.
- 3. The typical procedure for updating your system is to replace the existing files on your system with the files supplied on the media. You may, when it's possible, want to store the new file to disc on a different CRN or volume. Then, when you're sure it has transferred correctly, purge your old copy. This is just to ensure that you get a good copy of the new file before you destroy your old one.

After you have updated your software:

- 1. Generate your new system right away. If there have been any errors in the transfer process, they probably will be detected this way.
- 2. Check the revision codes of your software as they appear in the generation map against those listed in the software numbering catalog or file, and make sure you have not left out any modules.
- 3. Boot, initialize and use your newly generated system to make sure that it works correctly.
- 4. Make backup copies of your newly generated system. Use a new tape to backup your system. Keep the old copy until it's time to update once again, and then use it to backup the next 'new' system. This way you will keep at least two revisions backed-up by rotating your media.
- 5. Keep the update media together with your old backup media. If you discover problems later, you will always be able to get back to where you started and go through the update procedure again.

NOTE: If Operating System software has not changed and there are no changes affecting your generation (e.g., generated-in libraries), then regeneration is not necessary and on-line reloading will be sufficient. Otherwise regeneration is necessary before reloading on-line.

#### 5.2 Media Content

All the updates to the software for a product are distributed on the media requested by the customer. Depending on the product, there will be differences in what software is included on the media. The following table provides an overview of the different configurations possible with respect to software content and format:

	Media Option	Format	Operating Systems	Subsystems
010	Paper Tape		(A)	(A)
020	Minicartridge	READR/SAVER FMGR 'ST' CI 'CO'	(A) (A) -	(B) (B) (C)*
022	CS/80 CTD	FC TF VCP Bootable	(C) (C)	(C) (C) (B)**
041	Floppy Disc	Mountable FMGR CRN Mountable CI volume	(B) -	(B) (C)*
042	Mini-Floppy	Mountable FMGR CRN Mountable CI volume	(B) -	(B) (C)*
044	Micro-Floppy	Mountable FMGR CRN Mountable CI volume	(B) -	(B) (C)*
050	Mag Tape 800	READR/SAVER FC FMGR 'ST' TF	(C) (C) (A)	(C) (C) (B) (C)
051	Mag Tape 1600	READR/SAVER FC FMGR 'ST' TF	(C) (C) (A)	(C) (C) (B) (C)

- (A) Only the files that have changed will be included on the media.
- (B) Each individual media part no. (i.e. one minicartridge, one disc, one mag tape) contains a certain subset of the files belonging to a product. If one or more of these files change, the entire media part containing that file or files will be shipped. For example, suppose the following media part numbers for a product contain the following files:

9xxxx-1xx01 - File A, File B, File C

9xxxx-1xx02 - File D, File E

9xxxx-1xx03 - File F, File G, File H

If file B, file F, and file H are updated, the customer receiving this option would receive the media part numbers 9xxxx-1xx01 and 9xxxx-1xx03. Notice that the customer would also get files A, C, and G even though these files haven't changed.

- (C) All the files belonging to the product will be sent.
- \* This update only. Next update will be (B).
- \*\* Restored Off-line

# 5.3 Update Procedures

Updated software is stored on media in one of several formats. The above table shows the formats currently being used for different media types. Note that each physical media carries a label identifying the part number of the media, a description and a revision code.

On media with files to be restored to hard disc (e.g., all floppies; TF, FC, Saver, Writt, and FMGR 'ST' (store) tapes; and mini-cassettes) there is a new file called "HPHPHP" which describes each of the software parts. Information provided for each part includes:

Part number Software revision code Module number File type File name

Each media piece (each tape, mini-cartridge, floppy, etc.) with a revision code after 2340 (all software updated at C.83 is 2401 or greater) will have an HPHPHP file.

The information in HPHPHP is helpful to the user who wants to know what files are on the medium. For example, if the medium was missing a software module that was listed in HPHPHP, the user would call his/her support office and request the missing software.

On each tape or mini-cartridge, HPHPHP is the first file. On floppies, HPHPHP is the first file appearing in the directory listing.

The HPHPHP file has no part number.

Diagnostics and primary systems do not require an HPHPHP file.

#### 5.3.1 Paper Tape

- A single file is stored on the tape in FMGR 'ST' format.
- The file type of this file must be determined from the specific Software Numbering Catalog, Configuration Guide or Reference Manual for the product.
- The file is restored by using the FMGR 'ST' command (ex. :ST,4,FILEA:RT:32767::-1,BR).

# 5.3.2 Minicartridge in READR/SAVER format

- SAVER stores the software on to the tape file-by-file in a packed format.
- The tape can only be read using the READR utility; refer to the READR/SAVER Utility Reference Manual for detailed information on how to update your files. The recommended procedure is to use the UPdate function of READR to replace existing files on the system with new files from tape.
- With this update there are two library files for RTE-6/VM which cannot fit on a single minicartridge. The files each have been split into two parts. The files and their parts are

The file: ...has been split into:

\$TFLIB ---> \$TFLB1, \$TFLB2 \$FMP6 ---> \$FMP6X, \$FMP6Y

It will be necessary for customers receiving updates in this format to use the MERGE utility (refer to the RTE-6/VM Utilities Reference Manual (92084-90007) to merge the pieces back into the original libraries.

# 5.3.3 Minicartridge in FMGR 'ST' format

- Three or more files are stored on a minicartridge; the first file is the HPHPHP file, the second file is a directory of all the files on the medium. NOTE: This used to be the first file. The directory (second) file has entries of 128 words for each file on the medium. The format is as follows.

words 1-3: file name
4: type S - AS (ASCII)
R - BR (relocatable)
A - BA (binary absolute)
D - BN (data)
5: blank
6-128: description.

All the files, including the directory, are stored on tape in FMGR 'ST' format in the order in which they appear in the directory.

- Files may be restored by the '&UPDAT' FMGR transfer file (in an RTE-TI, IVA and IVB environment only); this utility is described in the RTE Utility Programs Reference Manual.

Basically &UPDAT works as follows:

- . the directory is stored into a file called &DRCTY,
- . RDNAM is loaded from the relocatable %RDNAM::32767,
- . RDNAM reads &DRCTY and passes to &UPDAT the file names,
- . &UPDAT purges these files (it expects the files on CRN 32767 with security code RT),
- . &UPDAT uses the transfer file &PKDIS to pack CRN 32767,
- . &UPDAT stores each file off the minicartridge to disc.

Note that &UPDAT and &PKDIS expect the minicartridge to be on LU 5 and all files to be stored onto CRN 32767 with security code RT.

To use a different LU:

- . edit &UPDAT to modify all references to LU 5, or
- . do an LU switch (system LU command or session SL command) to point LU 5 to the desired device EQT and subchannel before executing &UPDAT.

To use a different CRN or Security Code:

- . edit &UPDAT and &PKDIS to provide the correct CRN and security code for the existing files as follows:
  - in &UPDAT, edit the line at the beginning of the
    - Software Update Notice -

transfer file that sets global 1G to RT and/or global 2G to 32767 (globals referenced throughout &UPDAT);
- in &PKDIS, edit the PK command to pack the appropriate CRN

- It is also possible (necessary for users in an RTE-L, XL, A and 6 environment) for the user to read the directory (it is an ASCII file) and store the files individually onto disc with FMGR 'ST' commands, giving the disc files the file names specified in the directory file. When creating the disc files, use the file type according to the type given in the directory file. Also, it's recommended that a file size of -1 be specified so FMGR can make the file as big as it needs.

For example:

Directory Entry	FMGR Command
FILFA S	:ST,5,FILEA:RT:32767::-1,AS
FILEB R	:ST,5,FILEB:RT:32767::-1,BR
FILEC A	:ST,5,FILEC:RT:32767::-1,BA
FILED D	:ST,5,FILED:RT:32767::-1,BN

Remember, when restoring the tape individually, either purge the existing copy of the file before storing the new one to disc, or store the file to a different CRN and purge the old file after the transfer is successful.

#### 5.3.4 Minicartridge in CI 'CO' format

To restore files from mini-cartridges in CI COpy format to disc, use the following procedures:

### Step 1:

CI> CO 4 HPHPHP	(copy the first file from LU 4)
CI> CN 4 FF	(skip the first file)
Step 2:	
CI> CO 4 filename	(copy the second file - transfer file)
Step 3:	
CI> LI, filename	(list and review the transfer file to check all the values needed for globals used in Step 4)

<sup>-</sup> Software Update Notice -

Step 4:

CI > TR filename globals...

(transfer to the file to restore the remaining files to the disc LU)

\*\*\*\*\* WARNING \*\*\*\*\*

CI MINI-CARTRIDGES (CARTRIDGE TAPE UNITS) CANNOT BE READ ON MUX TERMINALS. SYMBOLIC DEBUG/1000 (92860A #020) IS THE ONLY PRODUCT CURRENTLY DISTRIBUTED ON CI MINI-CARTRIDGES.

# 5.3.5 CS/80 CTD in 'FC' format

- Consult the Utilities Reference Manual on how to use the 'FC' utility.
- A CTD tape contains one or more products, each product being identified by a CRN (Graphics may have more than one CRN).
- The comment file created by FC on the CTD identifies which subsystems are stored on tape, what files belong to each subsystem, their revision code, their file type and their CRN. To list the comment file do:

:RU,FC

FC:LL, list device LU

FC:LC,CTD LU

FC:EX

- Example on how to use 'FC':

:RU,FC

FC:CO,-LU(::xx),::yy,V

where

-LU = negative LU of the CTD

xx = CRN identifying the files for a given
product on CTD (reported by the "LC"
command under "FC").

yy = CRN on your disc.

V = verify

This will copy all the files from CTD with reference to CRN 'XX' onto the disc on CRN 'YY' and will verify each transfer. Files

<sup>-</sup> Software Update Notice -

with duplicate name will not be copied and FMGR-002 errors will occur.

- This update will also include the addition of customized CTD's where each tape will include multiple subsystem updates. Information on updating, in addition to appearing here, is included in the FC comment file along with the CRN's and the customer order number. Each customized tape may contain files from one or more CRNs. In order to remove these, do the following:

:RU,FC

FC: CL,-xx Command to list CRNs stored on FC tape, where xx is the source tape lu (e.g. CL,-13 if CS80 tape lu

is 13).

FC: GR

to destination disc cartridge.

(e.g. CO,-13(::32754),30,VF

moves CRN 32754 from tape to
disc CRN 30). Use a CO command

FC: CO, -xx(: nnnnn),ddddd,VF for each CRN that is to be

FC: EG removed from tape.

"nnnnn" is the CRN on tape that you wish to move to disc, and "ddddd" is the destination disc CRN or LU on which the information will be stored (refer to Utilities Reference manual for more information on the FC program).

### 5.3.6 CS/80 CTD in 'TF' format

- Consult the Utilities Reference Manual on how to use the 'TF' utility.
- Consult the subsystem or language configuration guide. At A.84, there are no custom tapes. Therefore, only one product per tape.
- Each CTD tape contains only one product; different products are on different CTD's: Each product is under a different global directory.
- The HPHPHP file contains a list of all files on that tape.

- Example on how to use 'TF':

CI > TF

TF: CO, lu{/global1/@},/global2/@,V

where lu = LU of the CTD

global1 = Global directory identifying the files for a given product on CTD.

global2 = Global directory on your system

V = verify

This will copy all the files from CTD with global directory /global1 onto the disc on directory /global2 and will verify each transfer (If the directory names are the same, the second parameter can be just "@"). Files with duplicate name will not be copied and duplicate file errors will occur. To replace duplicate files, use the 'D' option.

Optionally, you could use the following.

CI > TF

TF: CO, lu,, V

This would copy all files from the tape(lu) to your disc under the directory name that the files are stored on the tape.

- 5.3.7 CS/80 CTD in "VCP BOOTABLE" format
- Consult the appropriate Diagnostic Manual.
- "VCP BOOTABLE" means that these files are loaded directly from tape into memory, then executed by following the instructions in the appropriate diagnostic manual. The CTD media update in this format replaces the older version of the media.
- 5.3.8 Diskettes in "Mountable FMGR CRN" format
- Mount the floppy with the FMGR 'MC' command.

#### 5.3.9 Diskettes in "MOUNTABLE CI Volume" format

On CI floppies, /F/RESTORE\_FLOPPY, a CI transfer file will restore the floppy to hard disc. In addition, all CI floppies have /F as the only global directory. This means that if the user is supposed to be sent a file /FASCAL/PASCAL.LIB, he will instead be sent /F/PASCAL/PASCAL.LIB. All directories are subordinated to /F to allow the CI transfer file, RESTORE\_FLOPPY to put files in the correct directory without having a duplicate directory error.

Restore software from a CI floppy to hard disc using the following procedure.

1. Make sure the directory /F does not already exist on any CI mounted volume. If so, rename the directory. The floppy has a /F global directory and if a /F already exists and is mounted before the user mounts his new floppy, CI will issue the message:

Duplicate Directory /F

and the contents of the floppy will be inaccessible.

2. CI> MC lu mount the floppy lu
CI> LI /F/RESTORE\_FLOPPY list and review the transfer f
to check the value needed for
global in the next step

CI> TR /F/RESTORE\_FLOPPY,CI\_volume transfer to RESTORE\_FL CI> DC lu dismount the floppy lu

The transfer file will overwrite any software that already exists by the same name and destination path. Save or rename files that should not be overwritten.

When the user transfers to RESTORE\_FLOPPY, files are restored from the floppy to the hard disc. Files disc will NOT have the /F global directory.

The user may ignore duplicate directory errors from the CI CRDIR commands.

The rationale for the /F scheme is as follows: Suppose a floppy is sent without the /F directory and the top directory is called /PASCAL. Now the user wants to restore the floppy to disc. The destination directory can not be called /PASCAL because only one /PASCAL can exist at one time. So, the user will have to call the

destination directory something else. The /F scheme will prevent this problem.

Products Affected, options 040-04x: 92081A Image/1000-II 92833A Pascal/1000 92857A Basic/1000C 92860A Symbolic Debug/1000

Special note for 92861A DGL/1000 Version 2 and 92862A AGP/1000 Version 2: The above /F scheme was not implemented for the A.84 PCO cycle.

- 5.3.10 Mag Tape in READR/SAVER format
- See above section "Minicartridge in READR/SAVER format".
- 5.3.11 Mag Tape in 'FC' format
- Consult the Utility Programs Reference Manual on how to use the 'FC' utility.
- A Mag Tape contains only one product.
- Example on how to use 'FC':

:RU,FC FC:CO,-8,-disc LU,V

This will copy all the files for the product from the MT to the disc LU (or CRN) and will verify each transfer. Note that if files exist on that disc LU with identical names, those files will not be copied from the tape and FMGR-002 errors will occur.

- 5.3.12 Mag Tape in FMGR 'ST' format
- See above section "Minicartridge in FMGR 'ST' format".

- &UPDAT was designed with minicartridges specifically in mind, but it can also be used on mag tapes if:
  - . LU 5 is the mag tape LU, or
  - . LU 5 is switched to point to the mag tape EQT, or
  - . the user edits &UPDAT.
- The user can also store the files off the tape individually using the file names and types given in the directory.
- Note that some products may have a transfer file or other means for storing files off mag tape. See the appropriate Configuration Guide or Reference Manual for specific information.

# 5.3.13 Mag Tape in 'TF' format

- Consult the Utility Programs Reference Manual on how to use the 'TF' utility.
- A Mag Tape contains only one product.
- For an example of how to use 'TF', refer to the section CS/80 CTD in 'TF' format.
